Q1. What is the job of BIOS?

- (A) Initializing system hardware parts
- (B) Updating the system
- (C) Ensuring system performance
- (D) Protecting the system from being erased

Solution: The correct answer is (a) Initializing system hardware parts. Explanation: Initializing system hardware parts: BIOS's (Basic Input/Output System) main function is to initialize and test the system's hardware components during the boot process. It ensures that essential hardware such as the processor, memory and storage devices are functioning properly before control is handed over to the operating system. Updating the system: system updates are generally managed by the operating system, not BIOS. However, BIOS can be updated (flashed) for improvements. Ensuring system performance: BIOS settings can affect system performance (like enabling or disabling certain hardware features), but it isn't directly responsible for ongoing performance management. Protecting the system from being erased: BIOS does not protect the system from being erased. It only initializes hardware and performs basic system checks. Protection from data erasure is typically managed by software or system security protocols.

Q2. Which of the following file formats does MS PowerPoint use to open and save files in Windows?

- (A) DOC
- (B) XLS
- (C) JPEG
- (D) PPT

Solution: The correct answer is d: PPT. PPT — the PPT file format is used by Microsoft PowerPoint to save presentations. It is the standard file extension for presentations created in versions of PowerPoint before PowerPoint 2007. PowerPoint uses this format to store slides, text, images and other presentation elements. Explanation of other options: DOC — the DOC file format is used by Microsoft Word to save documents. It is the standard file extension for Word documents before Word 2007. DOC files contain text, images and formatting used in word processing documents, not presentations. XLS — Microsoft Excel spreadsheets use the format XLS (for Excel 2003 and earlier) or XLSX (for Excel 2007 and later). XLS and XLSX files are used to store spreadsheets and data in Microsoft Excel, not presentations. JPEG — JPEG (Joint Photographic Experts Group) is an image file format commonly used for photographs and graphics. It isn't used by Microsoft PowerPoint to save presentation files.

Q3. Which of the following is not an internal command of DOS?

- (A) FORMAT
- (B) VER
- (C) COPY
- (D) VOL

Solution: (a) Internal command is a MS-DOS command that is stored in the system memory when the booting process gets completed for e.g. VER,COPY,VOL,TIME,DATE etc. External command requires external files to be loaded in the computer so that they can run. for e.g.FORMAT.EXE,CHKDSK.EXE etc.

Q4. A _____ is a tool used in MS-Excel 2010 to calculate, summarize and analyze data and lets you see comparisons, patterns and trends in your data.

- (A) pivot table
- (B) conditional table
- (C) reference table
- (D) lookup table

Solution: (a) A Pivot Table is used to summarize, sort, reorganize, group, count, total or average data stored in a table. Reference

table → A structured reference, or table reference, is a special way for referencing tables and their parts that uses a combination of table and column names instead of cell addresses. Lookup tables → LOOKUP tables in Excel are named tables used with the VLOOKUP function to find any data. When we have a large amount of data and do not know where to look, we can select the table and name it.

Q5. What is the purpose of conditional formatting in Excel?

- (A) Changing the font style of all cells
- (B) Highlighting cells that meet certain criteria
- (C) Applying a filter on the worksheet
- (D) Inserting a hyperlink

Solution: The correct answer is option B. Changing the font style of all cells: conditional formatting in Excel is not primarily used to change the font style of all cells — instead, it lets you apply formatting rules to cells based on specific conditions. Highlighting cells that meet certain criteria: this is the correct purpose of conditional formatting — you can use conditional formatting to automatically highlight cells that meet criteria you define, for example, showing cells with values above a certain threshold in a different colour to draw attention. Applying a filter on the worksheet: conditional formatting differs from applying a filter — filters let you show or hide rows based on criteria, but they don't directly change the appearance of cells. Conditional formatting, on the other hand, focuses on visually enhancing cells based on conditions. Inserting a hyperlink: conditional formatting does not involve inserting hyperlinks — as mentioned, it relates to changing the appearance of cells based on conditions, whereas inserting a hyperlink means adding a link to text in a cell.

Q6. What would be the value of the CEILING (37, 6) command in MS Excel 2010?

- (A) 36
- (B) 40
- (C) 38
- (D) 42

Solution: The correct answer is option D. The CEILING function is used in MS-Excel 2010 to round a number up (higher). Example: CEILING (37, 6) → $6 \times 7 = 42 > 37$, so the value of CEILING (37,6) is 42.

Q7. In MS Excel 2010, a cell may display '#####' if that cell contains a number or a date and the width of its column cannot display all the characters that its format requires.

- (A) ###
- (B) #####
- (C) \$\$\$\$\$
- (D) *

Solution: (b) Microsoft Excel might show ##### in cells when a column isn't wide enough to show all of the cell contents.

Q8. Which memory allows the execution of processes that are not completely in main memory?

- (A) Virtual
- (B) Buffer
- (C) Primary
- (D) Flash

Solution: (a) The main advantage of virtual memory is that an OS can load programs larger than its physical memory. It makes an impression to the users that the computer has unlimited memory. It also provides memory protection. Buffer memory → Buffer is a region of a memory used to temporarily store data while it is being moved from one place to another. Primary memory → Primary storage is the component of the computer that holds data , programs and instructions that are currently in use. Flash memory → It is a kind

of memory that retains data in the absence of a power supply.

Q9. Data transfer between memory and the ALU is done by _____.

- (A) BUS
- (B) Register
- (C) ALU
- (D) Control unit**

Solution: The correct answer is option D. The control unit receives instructions from memory. The control unit decodes the instruction (decides what it means) and directs that the required data be moved from memory to the arithmetic/logic unit.

Q10. Which of the following is the fastest communication channel?

- (A) Optical fiber
- (B) Radio wave
- (C) Microwave**
- (D) All are operating at nearly the same propagation speed

Solution: (c) A microwave is the fastest communication channel whereas Optical fiber is a way of transferring data not a way of communication.

Q11. In what year was the World Wide Web invented?

- (A) 1985
- (B) 1989**
- (C) 1987
- (D) 1982

Solution: The correct answer is (b). The World Wide Web (WWW) was invented by English computer scientist Tim Berners-Lee in 1989 while working at CERN. He proposed the 'Universal Linked Information System', which included several concepts and technologies, including links between information. Tim Berners-Lee developed the first web server, the first web browser, and a document formatting protocol called HyperText Markup Language (HTML). After publishing HTML in 1991 and releasing the browser source code for public use in 1993, other web browsers emerged, including Mosaic (later Netscape Navigator), which played a significant role in fueling the internet boom in the 1990s. The web became accessible to the general public, resulting in the dot-com boom and bust in the late 1990s and early 2000s. HTML evolved over time, and features like CSS and JavaScript transformed web design, ushering in the era of Web 2.0. Today, the web is ubiquitous in daily life, allowing users to access documents and media content through web servers and web browsers.

Q12. Which of the following keyboard shortcuts is used to open the Downloads window in Chrome browser?

- (A) Ctrl + J**
- (B) Alt + D
- (C) Alt + J
- (D) Ctrl + D

Solution: (a) Ctrl + J is used to open the Downloads window in Chrome browser. Alt+D is a keyboard shortcut most often used to select the URL in the address bar in Internet browsers. Alt+J is a keyboard shortcut most often used to adjust the justification of text in a file. Ctrl + D creates a new bookmark or favourite for the current page.

Q13. In MIME, I stand for _____ .

- (A) Internet**
- (B) Intranet
- (C) Induce
- (D) Inspect

Solution: (a) MIME (Multipurpose Internet Mail Extensions) is an extension of the original Simple Mail Transport Protocol (SMTP) email protocol.

Q14. _____ printers are printers that print one page at a time.

- (A) Thermal
- (B) Laser**
- (C) Chain
- (D) Dot matrix

Solution: Laser printers are known for their ability to print one page at a time, as they use a laser beam to create an electrostatic image on a rotating drum, which is then transferred and fused onto a sheet of paper. This process allows for high-speed, high-quality printing one page at a time.

Q15. Which of the following options defines an operating system?

- (A) It is software used to convert source program instructions into a target program
- (B) It is a set of programs used to convert high-level language into low-level language
- (C) It is a set of programs that controls how a computer works and runs other programs**
- (D) It is the actual way of working on a computer

Solution: The correct answer is (c) It is a set of programs that controls how a computer works and runs other programs. (c) It is a set of programs that controls how a computer works and runs other programs: an Operating System (OS) is a collection of software that manages hardware resources and provides services to computer programs. It controls the computer's functioning and enables other programs to run. It is software used to convert source program instructions into a target program: this is the function of a compiler or interpreter, not an operating system. It is a set of programs used to convert high-level language into low-level language: this is also the function of a compiler or interpreter, not an operating system. It is the actual way of working on a computer: while an operating system facilitates working on a computer, this definition doesn't clearly express the operating system's actual functionality.

Q16. The process of selecting data concisely and presenting it in a way that is useful to the recipient is called _____.

- (A) Program
- (B) Information**
- (C) Input
- (D) Instruction

Solution: The correct answer is option B. The process described in the question involves taking raw data, organizing and summarizing it, and then presenting it in a format that is easily understandable and valuable to the recipient. This process is commonly called 'information'. Program: a program is a set of instructions that tells a computer how to perform a specific task — it consists of a sequence of steps or algorithms. Information: information refers to processed data that has been analyzed, organized, and presented in a meaningful way to provide insight or knowledge — it is the result of selecting and summarizing data for communication and understanding. Input: input refers to data or instructions provided to a computer or system. Instruction: an instruction generally refers to a step or command given to a computer, usually as part of a program.

Q17. A scanner scans _____

- (A) pictures
- (B) text
- (C) both pictures and text**
- (D) Neither pictures nor text

Solution: (c) A scanner is a device that captures images from photographic prints, posters, magazine pages and similar sources for computer editing and display.

Q18. Which of the following folders is commonly used to store any deleted emails?

- (A) junk
- (B) draft
- (C) Sent
- (D) trash**

Solution: (d) Deleted emails are usually stored for a defined time in

the trash folder. The spam (junk) folder is the storage space in your email account for unwanted emails. Draft folder is used to store unsent emails.

Q19. Which of the following is the world's first calculating machine?

- (A) **Abacus**
- (B) Napier Bones
- (C) Slide Rule
- (D) Leibniz Calculator

Solution: The correct answer is option A. The world's first calculating machine is the abacus. The abacus is an ancient counting and calculating device thousands of years old. It consists of beads or stones moved along rods or grooves to perform arithmetic calculations. The abacus played an important role in performing various mathematical tasks in early civilizations. Napier's Bones, also called Napier's rods, are a set of numbered rods used for multiplication and division. They were developed in the early 17th century by Scottish mathematician John Napier. The slide rule is a mechanical device used to perform mathematical calculations, particularly multiplication, division and exponentiation. It consists of two logarithmic scales that can be aligned and manipulated to perform calculations. The Leibniz calculator is also called the Leibniz wheel or stepped drum. Gottfried Leibniz designed a calculating machine called the Step Reckoner. Leibniz's calculator is also known as the first true four-function calculator.

Q20. Which of the following general purpose softwares allow you to do mathematical or financial calculation?

- (A) **Spreadsheet program**
- (B) Word processing program
- (C) Database program
- (D) Presentation program

Solution: (a) Spreadsheet program → Spreadsheet software is used to forecast future performance, calculate tax, complete basic payroll, producing charts and calculating revenues for e.g. MS excel. Word processors → A word processor is a software program capable of creating, storing and printing documents for e.g. MS Word. DBMS → (Database Management System) A DBMS refers to the software that is responsible for sorting, maintaining and utilizing a database for e.g. MY SQL. Presentation program → Presentation is the practice of showing and explaining the contents of a topic to an audience or a learner visually for e.g. keynote, ludus etc.

Q21. _____ involves traversing the entire file system, marking everything that can be accessed.

- (A) Index pointer
- (B) **Garbage collection**
- (C) File system
- (D) Stack pointer

Solution: The correct answer is (b) Garbage collection. Garbage collection is a process used by operating systems and programming languages to automatically reclaim memory that is no longer in use by a program. It involves identifying and marking objects that are no longer needed or accessible, so their memory can be reclaimed and reused. Index pointer (a): an index pointer generally refers to a data structure used to access elements within a data structure or file, which isn't related to marking everything accessible in a file system. File system (c): a file system is a method of storing and organizing files on a storage device, but it doesn't specifically involve marking everything that can be accessed. Stack pointer (d): a stack pointer is a register that holds the address of the current top element of the stack, used in programming and computer architecture, but it isn't related to file system traversal.

Q22. Which of the following computers is not considered a portable computer?

- (A) Notebook computer
- (B) Laptop
- (C) **Mini computer**
- (D) PDA

Solution: (c) A Portable computer is a computer that comes with a keyboard and display and one which can be easily relocated or transported, e.g. laptop, PDA. Minicomputer is not an example of portable computer.

Q23. C++ is an example of which type of computer language?

- (A) **Object-oriented language**
- (B) String and list processing
- (C) Visual programming language
- (D) Business data processing

Solution: The correct answer is: (a) Object-oriented language. Explanation: Object-Oriented Language: C++ is mainly known as an object-oriented programming language, which allows creating objects that can bundle data and functions together. It supports principles like inheritance, polymorphism, and encapsulation. Other options: (b) String and List Processing — while C++ can handle string and list processing, it isn't primarily categorized under this. (c) Visual Programming Language — C++ isn't a visual programming language; visual languages use graphical elements rather than text code. (d) Business Data Processing — while C++ can be used in business applications, it isn't specifically designed for business data processing; this category is more associated with languages like COBOL.

Q24. What is the use of Ctrl+Alt+1 ?

- (A) **To apply the Heading 1 style.**
- (B) To apply the Normal style.
- (C) To display the Styles task pane.
- (D) To enable AutoFormat.

Solution: (a) We use Ctrl+Alt+1 to apply the Heading 1 style.

Q25. Name the unit which sends the processed results to the user.

- (A) **Output**
- (B) Input
- (C) Memory
- (D) CPU

Solution: (a) Output unit sends the processed results to the user. It is mainly used to display the desired result to the user as per input instruction. e.g. Monitor, printer, plotter, etc.
