Q1.is a collection of web-pages andis the very first page that we see on opening of a website.

- (A) Home page, Web page
- (B) Website, Home page**
- (C) Web page, Home page
- (D) Web page, Website

Solution: (b) A website is a collection of linked web pages (plus their associated resources) that share a unique domain name. Home page → The first Web page that is displayed after starting a Web browser like Netscape's Navigator or Microsoft's Internet Explorer.

Q2. The relationships between cells are called as ____ .

- (A) Formulas**
- (B) Field
- (C) Record
- (D) Tuple

Solution: (a) Formula establishes a relationship between two or more cells. Tuple → A Tuple in DBMS is just a row that contains inter-related data about a particular entity. Field → A field is a data structure for a single piece of data. Fields are organized into records, which contain all the information within the table relevant to a specific entity. Record → A record is a collection of data relating to a single unit.

Q3. The process of a computer transferring information into the server on the Internet is called ____

- (A) Unloading
- (B) Sorting
- (C) Downloading
- (D) Uploading**

Solution: (d) Uploading is the transmission of a file from one computer system to another, usually larger computer system.

Q4. The rules governing the sending, traveling and receiving of information within the Internet are called

- (A) Protocols**
- (B) Algorithms
- (C) Programs
- (D) Procedure

Solution: (a) A network protocol is an established set of rules that determine how data is transmitted between different devices in the same network.

Q5. _____ allows users to upload files to an online site so they can be viewed and edited from another location.

- (A) General-purpose applications
- (B) Microsoft Outlook
- (C) Web-hosted technology**
- (D) Office Live

Solution: (c) A web hosting service is a type of Internet hosting service that hosts websites for clients, i.e. it offers the facilities required for them to create and maintain a site and makes it accessible on the World Wide Web. Companies providing web hosting services are sometimes called web hosts. General-purpose applications → General purpose application software is a type of application that can be used for a variety of tasks. It is not limited to one particular function. Microsoft Outlook → Outlook allows you to send and receive email messages, manage your calendar, store names and numbers of your contacts, and track your tasks.

Q6. Which of the following applications can be used for real time interaction?

- (A) E-Mail
- (B) Usenet

(C) Webpage

(D) Instant messaging

Solution: (d) Instant Messaging (IM) Instant messaging provides the ability to send textual messages, usually short ones in rapid sequence, between business colleagues and personal friends.

Q7. Which of the following is the full form of 'BCC', a field of E-mail header?

- (A) Blind carbon copy**
- (B) Blind common copy
- (C) Basic carbon copy
- (D) Basic common copy

Solution: (a) Blind carbon copy (Bcc) allows the sender of a message to conceal the person entered in the Bcc field from the other recipients. The difference between the two is that, while you can see a list of recipients when CC (Carbon copy) is used, that's not the case with BCC. Control + Shift + C to get to the CC field and Control + Shift + B to get to the BCC field.

Q8. Which of the given options best describes the truth of the following statements? i) RSS is a process that makes the content of one website available on another website. ii) 'Cookies' are information created by a web server and stored on the user's computer. iii) A web server is a type of Database Management System (DBMS).

- (A) i-true, ii-false, iii-true
- (B) i-false, ii-true, iii-true
- (C) i-true, ii-true, iii-true
- (D) i-true, ii-true, iii-true**

Solution: The correct answer is: (i) True and (ii) True; (iii) False. RSS (Really Simple Syndication): True: RSS is indeed a process that allows content from one website to be made available on another website. It is commonly used to deliver updates from blogs, news sites and other online publishers to subscribers. Cookies: True: cookies are small pieces of data created by a web server and stored on the user's computer. They are used to remember information about the user, such as login details or preferences, to enhance the browsing experience. Web server: False: a web server is not a type of Database Management System (DBMS). A web server is a system that delivers web pages to users over the internet, while a DBMS is software used to store, retrieve and manage data in databases.

Q9. provides total solutions to reduce data redundancy, inconsistency, dependence and unauthorized access of data.

- (A) DBMS
- (B) Tables
- (C) Database
- (D) Protection password**

Solution: (d) Password protection is an access control technique that helps keep important data safe from hackers by ensuring it can only be accessed with the right credentials. A table is a collection of related data held in a table format within a database. It consists of columns and rows.

Q10. _____ type of malware that is designed to gain administrative level control over a computer system without being detected.

- (A) Payloads
- (B) Freeware
- (C) Rootkits**
- (D) Update

Solution: (c) A rootkit is a malicious software bundle designed to give unauthorized access to a computer or other software. Payloads → Payload is the carrying capacity of a packet or other transmission data unit. Freeware → Freeware is in contrast to

commercial software, which is typically sold for profit, but might be distributed for a business or commercial purpose in the aim to expand the market share of a premium product.

Q11. First computer mouse was built by_____ .

- (A) **Douglas Engelbart**
- (B) William English
- (C) Oaniel Coogher
- (D) Robert Zawacki

Solution: (a) Mouse was invented by Douglas Engelbart at Stanford Research Center in 1963.

Q12. is the transmission of data between two or more computers over communication links.

- (A) Communication
- (B) Networking
- (C) **Data communication**
- (D) Data networking

Solution: (c) Data Communication is a process of exchanging data or information In case of computer networks this exchange is done between two devices over a transmission medium. Data networking refers to systems designed to transfer data between two or more access points via the use of system controls, transmission lines and data switching.

Q13. Which type of ROM can only be written to once?

- (A) **PROM**
- (B) EPROM
- (C) EEPROM
- (D) FROM

Solution: The correct answer is option A. PROM stands for Programmable Read-Only Memory. In PROM, data is written ('programmed') during the manufacturing process, and once programmed, it cannot be changed or erased. Data stored in PROM is permanent and can only be read.

Q14. To move the cursor to the end of a line of text in MS Word 2010, you have to press the _____ keyboard shortcut.

- (A) Ctrl + End
- (B) **End**
- (C) Home
- (D) Shift + Home

Solution: (b) End- Move the cursor to the end of the current line. Home- Move the cursor to the beginning of the current line. Ctrl+End- Move the cursor to the end of the document. Shift+Home- Select from the current position to the beginning of the current line.

Q15. Which was the first Apple computer?

- (A) **Apple I**
- (B) Apple II
- (C) Macintosh
- (D) Apple Lisa

Solution: The correct answer is (a) Apple I. Explanation: • Apple I: The Apple I was the first computer made by Apple, released in 1976. It was designed and hand-built by Steve Wozniak and was sold as a single-board computer without a case, keyboard, or monitor. • Apple II: The Apple II was the successor to the Apple I, released in 1977. It was one of the first hugely successful personal computers and came with a complete setup including a case and keyboard. • Macintosh: The Macintosh was introduced by Apple in 1984. It was one of the first computers to feature a graphical user interface and mouse, which set it apart from earlier models. • Apple Lisa: Released in 1983, the Apple Lisa was one of the first computers aimed at business users to offer a graphical user interface. However, it was not Apple's first computer.

Q16. The _____ layer coordinates the functions required to transmit a bit stream over a physical medium.

- (A) Transport

- (B) Network
- (C) Data link
- (D) **Physical**

Solution: The correct answer is option D. The physical layer is responsible for coordinating the functions required to transmit a bit stream over a physical medium. It deals with the actual transmission of raw binary data as electrical signals, light pulses, or other physical forms of data transmission. This layer focuses on the physical characteristics of the communication medium, such as cables, connectors and signal encoding.

Q17. Which of the following is used for very large files or where a fast response time is not critical. The files to be transmitted are gathered over a period and then send together as a batch.

- (A) Online processing
- (B) File processing
- (C) Data processing
- (D) **Batch processing**

Solution: (d) Batch processing is a technique for automating and processing multiple transactions as a single group for e.g.Unix.

Q18. Which of the following services is most commonly used with mobile phones to access the internet?

- (A) DSL
- (B) **3G-4G**
- (C) Dial up
- (D) Cable

Solution: (b) 3G and 4G service is most commonly used with mobile phones, and it connects wirelessly through your ISP's network, these connections aren't always as fast as DSL or cable. A digital subscriber line is a family of technologies that are used to transmit digital data over telephone lines. Dial-up is related to or is a standard telephone line used for computer communications.

Q19. How many function keys are present on a standard PC keyboard?

- (A) 10
- (B) 9
- (C) **12**
- (D) 15

Solution: The correct answer is: c. Explanation: a standard PC keyboard typically has 12 function keys, labelled F1 through F12. These function keys serve various purposes and can be used in combination with other keys to perform special functions. For example: F1 — opens the Help menu in many applications. F2 — allows editing a file or folder name. F3 — opens the search feature. F4 — closes a window or places the cursor in the address bar. F5 — refreshes web pages or starts a slide show in PowerPoint. F6 — navigates between panes in Microsoft Word. F7 — checks spelling and grammar. F8 — enables safe mode in Windows. F9 — refreshes documents in Word. F10 — opens the menu bar. F11 — enters full-screen mode in a browser. F12 — opens the 'Save As' dialog in Word.

Q20. Which of the following is/are true regarding EEPROM? I. It is erasable block-wise II. It is erasable bit-wise

- (A) Both I and II
- (B) **Only II**
- (C) Only I
- (D) Neither I nor II

Solution: The correct answer is option B. EEPROM stands for Electrically Erasable Programmable Read-Only Memory, and it is a type of non-volatile memory used in computers, typically integrated into microcontrollers such as smart cards and remote keyless systems, or as a separate chip device for storing relatively small amounts of data. It allows individual bytes to be erased and reprogrammed. EEPROMs are organized as an array of floating-gate transistors. EEPROM can be programmed and erased in-circuit by applying special programming signals. Originally, EEPROMs were

limited to single-byte operations, making them slow, but modern EEPROMs allow multi-byte page operations. An EEPROM has a limited lifespan for erasing and reprogramming, now reaching up to a million operations in modern EEPROM. In an EEPROM that is reprogrammed frequently, the EEPROM's lifespan is an important design consideration.

enhancing flexibility.

Q21. What is the function of Ctrl+Shift+F ?

- (A) It is used to hide the selected text.
- (B) It is used to display the Font dialog box.**
- (C) It is used to increase the font size.
- (D) It is used to decrease the font size.

Solution: (b) Ctrl+Shift+F is used to display the font dialog box.

Q22. Electromagnetic printers can produce documents at a speed of over _____ lines .

- (A) 10000
- (B) 30000
- (C) 20000**
- (D) 40000

Solution: (c) Electromagnetic printers can produce documents at a speed of over 20000 lines(i.e) More than 250 pages per minute.

Q23. Which one is a fast search algorithm with runtime complexity of $O(\log n)$?

- (A) Binary search tree
- (B) Spanning tree**
- (C) AVL tree
- (D) Both a and b

Solution: (b) Binary search is a fast search algorithm with run-time complexity of $O(\log n)$. This search algorithm works on the principle of divide and conquer. For this algorithm to work properly, the data collection should be in the sorted form. Spanning tree → A spanning tree is a subset of Graph G, which has all the vertices covered with a minimum possible number of edges. AVL tree → AVL tree is a self-balancing Binary Search Tree (BST) where the difference between heights of left and right subtrees cannot be more than one for all nodes.

Q24. EAROM in computers stands for:

- (A) Electrically Altered Read Only Memory
- (B) Electrically Accepted Read Only Memory
- (C) Electronically Alterable Read Only Memory
- (D) Electrically Alterable Read Only Memory**

Solution: The correct answer is option D. EAROM stands for Electrically Alterable Read Only Memory. It refers to a type of memory technology that allows data to be electrically read and modified. EAROM is a type of non-volatile memory, meaning it retains its data even when power is turned off.

Q25. Which concept in object-oriented programming allows a class to acquire properties and behaviours from another class?

- (A) Encapsulation
- (B) Abstraction
- (C) Inheritance**
- (D) Polymorphism

Solution: The correct answer is option C. Inheritance is a fundamental concept in object-oriented programming (OOP) that allows a class (known as a subclass or derived class) to acquire properties and behaviours from another class (known as a superclass or base class). It lets you create a hierarchy of classes where the subclass can reuse and extend the features and methods of the superclass. This promotes code reusability and organizes code in a more logical and structured way. Encapsulation focuses on bundling data and methods together in a class to ensure data protection and controlled access. Abstraction involves simplifying complex reality by modelling the essential properties and behaviours of objects. Polymorphism enables different classes to provide their own implementations of methods with the same method signature,
