Q1. What are spam mails in the context of email?

- (A) Emails that contain only images and no text.
- (B) Emails sent by the user's close friends or family.
- (C) Unwanted and often irrelevant or inappropriate emails sent in bulk.**
- (D) Emails that are automatically sorted into the primary inbox.

Solution: The correct answer is option C. Spam mail refers to unwanted and often irrelevant or inappropriate emails sent in bulk to a large number of recipients. These emails are typically sent without the recipients' consent and are often used for various malicious purposes or simply for advertising.

Q2. Which database language is used to access data in an existing database?

- (A) DML**
- (B) DDL
- (C) DCL
- (D) None of these

Solution: (a) A DML (data manipulation language) refers to a computer programming language that allows you to add, delete, and alter data in a database.

Q3. In which printers, Printing is achieved by deflecting laser beam on to photosensitive surface of a drum?

- (A) Dot Matrix
- (B) Daisy Wheel
- (C) Laser printer**
- (D) Electromagnetic printer

Solution: (c) In laser printers, printing is achieved by deflecting laser beams onto the surface of a drum. Dot Matrix → A dot matrix printer is a computer printer using a series of pins to stamp ink from a ribbon onto paper to produce words and numbers. Daisy Wheel → A daisy wheel printer is a specific type of mechanical impact printer popular in the 1970s that used individual letter, number and symbol keys to imprint text on paper. Electromagnetic printer → This printer uses magnetic recording techniques. By using this technique, the required output is written on a drum surface.

Q4. At least one resource must be held in a non-shareable mode. Otherwise, the processes would not be prevented from using the resource when necessary is known as _____ .

- (A) Mutual exclusion**
- (B) Non preemptive
- (C) Partial allocation
- (D) Circular wait

Solution: (a) Mutual exclusion → At least one resource must be held in a non-shareable mode; that is, only one process at a time can use the resource. Non preemptive → A resource can be released only voluntarily by the process holding it. Circular wait → One process is waiting for the resource, which is held by the second process, which is also waiting for the resource held by the third process etc.

Q5. Which of the following is known as the mouse port?

- (A) VGA port
- (B) PS/2 port**
- (C) USB port
- (D) Serial port

Solution: The correct answer is option B. The PS/2 port is often called the 'mouse port'. It is a type of port used to connect peripherals such as computer mice and keyboards to a computer. The PS/2 port was common in older computer systems and used a round, six-pin connector. However, modern computers have largely switched to using USB ports to connect mice and keyboards. A VGA (Video Graphics Array) port is used to connect monitors and displays to a

computer — it was used to transmit analog video signals and was commonly used in older computers. In modern systems, VGA has largely been replaced by digital interfaces such as DVI, HDMI and DisplayPort. A USB (Universal Serial Bus) port is a versatile port used to connect various types of devices to a computer, including external storage drives, printers, cameras and more. USB is a standard interface that allows high-speed data transfer and power delivery to connected devices. A serial port is a communication interface used to connect devices such as modems, serial mice and some older peripherals — it sends data one bit at a time in a sequential manner. Serial ports have largely been replaced by USB and other faster communication interfaces.

Q6. What does dots per inch (DPI) measure?

- (A) Number of bits
- (B) Density of graphic files stored on a hard disk
- (C) The density of bits on a disk
- (D) Density of the pixels on a computer screen**

Solution: (d) Dots per inch (DPI) is a measure of spatial printing, video, or image scanner dot density, in particular the number of individual dots that can be placed in a line within the span of 1 inch.

Q7. Which of the following stores the program and data currently being executed by the CPU?

- (A) Auxiliary memory
- (B) Primary memory**
- (C) Secondary memory
- (D) Tertiary memory

Solution: The correct answer is (b). Primary memory (also known as main memory or RAM - Random Access Memory) stores the program and data currently being executed by the CPU. Primary memory (RAM): primary memory is a type of volatile memory that provides the CPU with fast access to actively used data and instructions. It is essential for program execution and smooth operation of the system. When you run a program, it is loaded from secondary storage (like a hard drive) into primary memory so the CPU can access it quickly. Auxiliary memory: another term for secondary storage, such as hard drives, SSDs and external storage devices, used for long-term storage, not immediate execution. Secondary memory: refers to non-volatile storage used to store data permanently. Examples include hard drives, SSDs and optical discs. Tertiary memory: a type of storage used for archival and backup purposes, such as tape drives — not used for storing data currently being executed by the CPU.

Q8. Computer built before the first generation computer was _____ .

- (A) electromechanical**
- (B) mechanical
- (C) electrical
- (D) electronics

Solution: (a) The computers that were built before the first generation of computers were Electro-mechanical computers.

Q9. Which of the following is not Internet etiquette?

- (A) Size of attachments need to be small
- (B) Forwarding unwanted messages**
- (C) Including name at the bottom of mails
- (D) Using abbreviations wisely

Solution: (b) Internet etiquette thus describes the rules of conduct for respectful and appropriate communication on the internet. Some rules of etiquette are → Make sure identification is clear in all communications, respect others' privacy, don't spam.

Q10. What is the function of Shift+F5?

- (A) To copy the text.
- (B) To move the cursor to the next page.
- (C) To move the cursor to the location of the previous revision.**
- (D) To move the cursor to the end of the document.

Solution: (c) The function of Shift+F5 is to move the cursor to the location of the previous revision.

Q11. The attributes and methods for each object are stored in _____ .

- (A) An object repository**
- (B) An object connection
- (C) An assembly structure
- (D) An object instance

Solution: (a) Object Repository is a collection of objects and properties with which QTP will be able to recognize the objects and act on them. The attributes and methods for each object are stored in an object repository.

Q12. In MS-Word 2010, which shortcut key is used to delete a word to the right of the cursor?

- (A) Ctrl + Backspace
- (B) Delete
- (C) Ctrl + Delete**
- (D) Alt + Backspace

Solution: The correct answer is option C. Ctrl + Backspace: deletes the word to the left of the cursor. Delete: deletes the character ahead of the cursor. Ctrl + Delete: deletes the word to the right of the cursor. Alt + Backspace: alternate shortcut for the more famous Ctrl + Z, i.e. undo the last operation.

Q13. A collection of related files is called a _____ .

- (A) character
- (B) field
- (C) database
- (D) record**

Solution: (d) A record is a collection of data relating to a single unit.

Q14. The control unit controls other units by generating _____ .

- (A) control signal**
- (B) timing signal
- (C) transfer signal
- (D) command signal

Solution: (a) The basic function of the control unit is to fetch the instruction stored in the main memory, identify the operations and the devices involved in it and accordingly generate control signals.

Q15. Programming Language introduced in Which Generation?

- (A) First**
- (B) Second
- (C) Third
- (D) Fourth

Solution: (a) A first-generation (programming) language (1GL) is a grouping of programming languages that are machine level languages used to program first-generation computers. Second generation computer → Assembly language started in second generation. Third generation computers → Some examples of 3GLs are BASIC, COBOL, Pascal, Fortran, C, C++, Perl and Ada. Fourth generation computer → Examples of these languages include Perl, Python, Ruby, SQL, MatLab(MatrixLaboratory).

Q16. _____ refers to a network that spans a city or a large campus.

- (A) MAN**
- (B) WAN
- (C) PAN
- (D) LAN

Solution: The correct answer is option A. MAN stands for Metropolitan Area Network, which refers to a network spanning a city or a large campus, connecting multiple buildings and locations within a metropolitan area. A Wide Area Network (WAN) is a network covering a large geographic area, often spanning multiple cities, countries, or even continents. It connects several LANs and MANs, enabling communication over long distances. A Personal Area Network (PAN) is a small network used for communication among a person's nearby devices. It's commonly used to connect devices like smartphones, tablets, laptops, and other personal devices. A Local Area Network (LAN) is a network that spans a small geographic area, such as a building or a campus. It connects devices like computers, printers, and servers within a limited area, facilitating local communication and resource sharing.

Q17. Google Chrome is a/an _____.

- (A) Browser**
- (B) Social network site
- (C) Internet service provider
- (D) Mobile phone

Solution: (a) Google chrome is a fast, secure, free web browser.

Q18. Computer speed depends on _____, assuming that if this particular component is low, it will take longer to load and the computer will become slow.

- (A) ROM
- (B) RAM**
- (C) Volatile memory
- (D) Secondary memory

Solution: The correct answer is option B. A computer's speed largely depends on its RAM (Random Access Memory). RAM is a type of volatile memory that provides fast access to data currently being used by the computer. It acts as a temporary workspace for the operating system and running applications.

Q19. 7 Which of the following keyboard shortcuts opens the FIND and REPLACE (or REPLACE) dialogue box in MS Word?

- (A) ALT + H
- (B) CTRL + H**
- (C) ALT + R
- (D) CTRL + R

Solution: (b) CTRL + H shortcut key opens the FIND and REPLACE (or REPLACE) dialogue box in MS Word. Alt + H opens the Home tab in the Ribbon. Alt + R opens the Review tab in the Ribbon. Ctrl+R aligns the line or selected text to the right of the screen.

Q20. ULSI stands for _____.

- (A) Ultra Large-Scale Integration**
- (B) Ultimate Large-Scale Integration
- (C) Upper Large-Scale Integration
- (D) Ultra Large-Script Integration

Solution: The correct answer is (a). Ultra Large-Scale Integration (ULSI) is a process of integrating millions of transistors onto a single silicon semiconductor microchip. The idea for ULSI technology emerged in the late 1980s, when advanced computer processor microchips — particularly for the Intel 8086 series — were being developed.

Q21. The central processing unit contains which of the following as a component?

- (A) Memory Regulation Unit
- (B) Flow Control Unit
- (C) Instructions Manipulation Unit
- (D) Arithmetic Logic Unit**

Solution: (d) The CPU has ALU (Arithmetic Logic Unit) for proceeding the given input. Flow Control Unit → Flow control is a design issue at Data Link Layer. It is a technique that generally observes the proper flow of data from sender to receiver.

Q22. Which of the following is not a binary number?

- (A) 001
- (B) 101
- (C) 202**
- (D) 110

Solution: (c) 202 does not come under binary number system because it contains only two unique digits 0's and 1's. It is also known as the Base 2 system.

Q23. In MS-Excel 2010 _____ is used to represent data in the form of bars and lines.

- (A) FILTER
- (B) SORT
- (C) TABLE
- (D) CHART**

Solution: (d) Chart → A chart is a tool you can use in Excel to communicate data graphically. Charts allow your audience to see the meaning behind the numbers, and they make showing comparisons and trends much easier. Table → The purpose of an Excel table is not so much to calculate new values but rather to store lots of information in a consistent manner, making it easier to format, sort, and filter worksheet data. The Filter Function filters an array based on a Boolean (True/False) array. Sort → Sorting data in MS Excel rearranges the rows based on the contents of a particular column.

Q24. Which of the following services allows users to buy and sell products online?

- (A) Video conferencing
- (B) Instant messaging
- (C) Streaming
- (D) E-commerce**

Solution: The correct answer is (d) E-commerce. E-commerce (electronic commerce) refers to online platforms and services that enable users to buy and sell products or services over the internet. Popular examples include Amazon, Flipkart and eBay, which provide tools for browsing goods online, placing orders, and paying securely. Video conferencing involves real-time video/audio communication over the internet (e.g. Zoom, Microsoft Teams) for virtual meetings, not buying/selling. Instant messaging platforms (WhatsApp, Telegram) enable real-time text communication but aren't primarily designed for e-commerce. Streaming refers to delivering audio/video/media content in real time (Netflix, YouTube), unrelated to buying/selling products.

Q25. Which among the following is not an example of a system software?

- (A) Operating system
- (B) Adobe Photoshop**
- (C) Software Driver
- (D) Debugger

Solution: (b) Adobe Photoshop is an example of (Desktop Publishing Software) which comes under application software. Debugger → A debugger is a computer program used by programmers to test and debug a target program. It is an example of system software. Software Driver → It is a set of files that tells a piece of hardware how to function by communicating with a computer's operating system. Operating system → An operating system (OS) is system software that manages computer hardware, software resources, and provides common services for computer programs for e.g. android, linux.
