Q1. Rules for exchanging data between computers are called

- (A) Programs
- (B) Procedures
- (C) **Protocols**
- (D) Hyperlink

Solution: (c) A network protocol is an established set of rules that determine how data is transmitted between different devices in the same network. Hyperlink → In a website, a hyperlink (or link) is an item like a word or button that points to another location.

Q2. 18 OSI stands for ____

- (A) Open Sound Interaction
- (B) Open Source Interaction
- (C) Operating system Interaction
- (D) **Open systems Interconnection**

Solution: (d) The OSI Model (Open Systems Interconnection Model) is a conceptual framework used to describe the functions of a networking system.

Q3. Text editor is a/an _____

- (A) application software
- (B) system software
- (C) **utility software**
- (D) all purpose software

Solution: (c) Utility software performs tasks related to the maintenance of the computer system for e.g. backup utilities, antivirus, text editor etc. Application software is the software that allows you to perform specific tasks like processing of examination results, pay calculations etc. System software consists of several programs, which are directly responsible for controlling, integrating and managing the individual hardware components of a computer system for e.g. mac os, linux, android. All purpose software are those softwares which are used for any general purpose. They allow people to do simple computer tasks.

Q4. Which protocol is used for communication on the internet?

- (A) DNS
- (B) **TCP/IP**
- (C) SNMP
- (D) DMZ

Solution: (b) TCP/IP stands for Transmission Control Protocol/Internet Protocol and is a suite of communication protocols used to interconnect network devices on the internet. The domain name system (DNS) is a naming database in which internet domain names are located and translated into Internet Protocol (IP) addresses. SNMP stands for Simple Network Management Protocol is an Internet-standard protocol for handling devices on IP networks. In computer security, DMZ stands for a demilitarized zone and is also known as perimeter network, or screened subnet.

Q5. 3000 GB is approximately equal to ____

- (A) 30 KB
- (B) 3 GB
- (C) **3 TB**
- (D) 30 GB

Solution: (c) 1TB is 1000 GB, therefore there are 3 terabytes in 3000 gigabytes.

Q6. Which of the following statement is correct about the use of Blind Carbon Copy (BCC) in Gmail?

- (A) It is used for sharing a copy of the email with 100 primary recipients
- (B) **It is used for sharing a copy of the email with someone**

without letting the primary the recipient knows about it.

- (C) It is used for sharing a copy of the email with 10 primary recipients.
- (D) It is used for sharing a copy of the email with all the primary recipients.

Solution: (b) BCC, which stands for blind carbon copy, allows you to hide recipients in email messages.

Q7. What do you call collecting the data and converting it into information ?

- (A) compiling
- (B) **processing**
- (C) importing
- (D) exporting

Solution: (b) Collecting data and converting it into information is called data processing. Compiling → It is the transformation from Source Code (which can be read by humans) into machine code (computer executable). It is done by a software known as compiler. Importing → It is the process of moving data or settings used in one program to another. Exporting → It is the process of converting a file into another format than the one it is currently in.

Q8. The _____ tells the computer's memory, arithmetic/logic unit, and input and output devices how to respond to a program's instructions.

- (A) Storage unit
- (B) Input device
- (C) **Control unit**
- (D) Logic unit

Solution: The correct answer is (c) Control unit. The Control Unit (CU) is an important part of the Central Processing Unit (CPU) in a computer. Its primary function is to interpret instructions from a computer program and execute them. The control unit: receives instructions from the computer's memory; decodes the instructions to understand which actions are needed; controls the operation of the arithmetic/logic unit (ALU), memory, and input/output devices by sending appropriate signals to carry out the instructions.

Q9. All the logical and mathematical calculations done by the computer happen in/on the ____ .

- (A) System board
- (B) **CPU**
- (C) Motherboard
- (D) Memory

Solution: (b) All the logic and mathematical calculations done by computer happen in the central processing unit. CPU is generally composed of the main memory, control unit and arithmetic-logic. Motherboard → The motherboard is the backbone that ties the computer's components together at one spot and allows them to talk to each other.

Q10. is the most important/powerful computer in a typical network.

- (A) Desktop
- (B) Network client
- (C) **Network server**
- (D) Network station

Solution: (c) A network server is a powerful computer that provides various shared resources to workstations and other servers on a network.

Q11. _____ has a matrix of rectangular cells grouped into rows and columns.

- (A) Document

(B) Spreadsheet

- (C) Text
- (D) Slide

Solution: The correct answer is (b) Spreadsheet. A spreadsheet is a matrix of rectangular cells, grouped into rows and columns. Each cell can hold data, such as numbers, text, or formulas. Well-known spreadsheet software includes Microsoft Excel and Google Sheets. Here's why the other options are wrong: (a) Document generally refers to a text-based file (like a Word document), which doesn't have a matrix structure. (c) Text refers to plain or formatted text, which isn't arranged in rows and columns. (d) Slide refers to a single page in a presentation (like a slide made in Microsoft PowerPoint), which isn't a matrix of cells. So, the correct option is: (b) Spreadsheet.

Q12. _____ is used to create a digital representation of a printed document or photograph.

- (A) Video digitizer
- (B) Scanner**
- (C) Monitor
- (D) None of the above

Solution: The correct answer is option B. A video digitizer is software that takes an analog video still frame and converts it into a digital still image; a video digitizer also requires the assistance of computer hardware. A scanner is a device that captures images from photographic prints, posters, magazine pages and similar sources for computer editing and display. Scanners work by converting the image on the document into digital information that can be stored on a computer via optical character recognition (OCR). A computer monitor is an output device that displays information in pictorial or textual form. A discrete monitor comprises a visual display, supporting electronics, power supply, housing, electrical connectors and external user controls.

Q13. Which of the following is NOT a feature of the internet?

- (A) Accessibility
- (B) Flexibility of communication
- (C) Ease of use
- (D) High cost**

Solution: (d) Features of Internet - Easy to Use, Interaction with Other Media Low Cost, Extension of Existing IT Technology, Flexibility of Communication 6. Security. accessibility .

Q14. Which among the following is the smallest unit in an image on a computer screen?

- (A) Unit
- (B) Pixel**
- (C) Array
- (D) Resolution

Solution: (b) Pixels are the smallest unit in a digital display. Up to millions of pixels make up an image or video on a device's screen. Unit → A system unit is the part of a computer that houses the primary devices that perform operations and produce results for complex calculations. Array → An array is a collection of similar types of data. Resolution → In general, screen resolution is the number of pixels a screen can show horizontally and vertically.

Q15. Which of the following concepts means determining at runtime what method to invoke?

- (A) Dynamic binding**
- (B) Dynamic Typing
- (C) Dynamic loading
- (D) Data hiding

Solution: (a) Dynamic binding or late binding is the mechanism a computer program waits until runtime to bind the name of a method called to an actual subroutine. Dynamic Typing → A programming language is said to be dynamically typed, or just 'dynamic', when the majority of its type checking is performed at run-time as opposed to at compile-time. Dynamic loading → A dynamic load is any load that

changes over time. These types of loads exert forces onto a structure that are often much greater than their static equivalents. Data hiding → Data hiding is an object-oriented programming (OOP) technique specifically used to hide internal object details (i.e., data members).

Q16. A Collection of information sorted and dealt with as a unit is a _____

- (A) Disk
- (B) Data
- (C) CD
- (D) File**

Solution: (d) A file is an object on a computer that stores data, information, settings, or commands used with a computer program. Disk → It is round, flat, and ridged that is written using a laser. An example of a disc is a Blu-ray, CD, and a DVD. CD → A compact disc is a portable storage medium that can be used to record, store and play back audio, video and other data in digital form. Data → Data is information that has been translated into a form that is efficient for movement or processing.

Q17. Which of the following is NOT an example of a web browser?

- (A) Opera
- (B) Google Chrome
- (C) Apple Safari
- (D) LinkedIn**

Solution: The correct answer is (d) LinkedIn. LinkedIn is a professional networking platform and social media website, not a web browser. Opera, Google Chrome and Apple Safari are all widely used web browsers.

Q18. What was the main component of third-generation computers?

- (A) Transistors
- (B) Large integrated circuits
- (C) Integrated circuits**
- (D) Optical fibre

Solution: The correct answer is option C. Third-generation computers used integrated circuits as their main component.

Q19. Which among the following is the shortcut key combination to copy formatting from text?

- (A) Alt + Shift + C
- (B) Tab + Shift + C
- (C) Ctrl + Shift + C**
- (D) F1 + Shift + C

Solution: (c) Ctrl + Shift + C is used to copy text formatting.

Q20. Which of the following input devices uses a light-sensitive detector to select an object on a screen?

- (A) Bar code reader
- (B) Optical mark recognition
- (C) Magnetic ink character recognition
- (D) Light pen**

Solution: The correct answer is option D. A light pen is an input device that uses a light-sensitive detector to select objects on a screen. When the light pen is brought into contact with the screen, it can detect the position of the pen's tip and interact with the screen's display, letting users make selections and perform various tasks. Light pens were commonly used in early computer systems for tasks like drawing and selecting options on screen.

Q21. 10 Which of the following is a system of e-banking where individuals, firms and corporate can electronically transfer funds from any bank branch to any individual, firm or corporate having an account with any other bank branch in the country participating in the scheme?

- (A) e-commerce

- (B) e-governance
- (C) e-ticketing
- (D) NEFT**

Solution: (d) The National Electronic Funds Transfer (NEFT) is an electronic payment system that facilitates direct one-to-one payments across the country.

Q22. Name the device which is used for making drawings, graphics and for menu selection.

- (A) Keyboard
- (B) Mouse
- (C) Touch screen
- (D) Light Pen**

Solution: (d) Light Pen is a handheld electro-optical pointing device, which is used for making drawings, graphics and for menu selection.

Q23. The _____ field indicates the address of the sender, i.e., who sent the email.

- (A) BCC
- (B) From**
- (C) To
- (D) Inbox

Solution: The correct answer is option B. BCC: Blind Carbon Copy is similar to Cc, except that the email address of recipients specified in this field does not appear in the received message header, and recipients in the To or Cc field won't know that a copy was sent to these addresses. In an email, 'From' indicates your identity, such as your company name or company title, whereas 'From' in an email represents your identifying email address. The To field is for the primary recipient(s) of your email. The Inbox is a repository in an email application that accepts incoming messages.

Q24. What does DDL mean in computers?

- (A) Dynamic Data Language
- (B) Data Definition Library
- (C) Data Definition Language**
- (D) Dynamic Data Library

Solution: The correct answer is option C. DDL stands for Data Definition Language. It is a subset of SQL (Structured Query Language) used to define and manage the structure of a database. DDL commands are used to create, modify and delete database objects such as tables, indexes, views and schemas.

Q25. NEFT (National Electronic Funds Transfer) is a banking service that is primarily used for:

- (A) Transferring funds between bank accounts in real time.**
- (B) International money transfers.
- (C) Withdrawals from Automated Teller Machines (ATM).
- (D) Buying stocks and bonds.

Solution: The correct answer is option A. NEFT (National Electronic Funds Transfer) is a banking service that facilitates the electronic transfer of funds between various bank accounts within India. It is a popular and widely used payment system that enables individuals and businesses to securely transfer funds from one bank to another.
