Q1. _____ is a form of computer data storage that stores frequently used program instructions to increase the general speed of the system.

- (A) Arithmetic Logic Unit
- (B) Integrated Circuit
- (C) Random Access Memory**
- (D) Portable Document Format

Solution: The correct answer is c: Random Access Memory. Random Access Memory (RAM): definition — RAM is a type of computer data storage that stores frequently used program instructions and data that the CPU needs while operating. RAM is volatile memory, meaning it retains information only as long as the computer is powered on. When the computer is turned off, data stored in RAM is lost. Main function — RAM plays a crucial role in increasing the system's general speed by allowing quick access to frequently used instructions and data, which speeds up processing and overall system performance. Arithmetic Logic Unit (ALU): definition — the ALU is a fundamental component of the CPU (Central Processing Unit) in a computer. It performs arithmetic and logical operations, such as addition, subtraction, comparisons, and bitwise operations. Main function — the ALU is responsible for executing instructions given by the computer's programs by performing calculations and making logical decisions, but it isn't involved in data storage. Integrated Circuit (IC): definition — an integrated circuit is a small electronic device made of semiconductor material, typically silicon, containing multiple electronic components like transistors, resistors and capacitors. ICs are used in nearly all electronic devices and are a key building block of modern electronics. Main function — ICs are used to perform a wide range of functions in electronic devices, including processing, memory storage and signal amplification, but they aren't specifically related to data storage like RAM. Portable Document Format (PDF): definition — PDF is a file format developed by Adobe used to present documents in a manner independent of application software, hardware and operating systems. PDF files can include text, images, links and even interactive elements like forms. Main function — PDF is used for exchanging documents and is widely used for sharing documents that need to preserve formatting across different devices and platforms. It isn't related to data storage in the context of increasing system speed.

Q2. What is the value of the following MS-Excel formula? =MOD(11, 3)

- (A) 2**
- (B) 4
- (C) 3
- (D) 5

Solution: (a) The Excel MOD function returns the remainder of two numbers after division. For example, MOD(11,3) = 2. The result of MOD carries the same sign as the divisor.

Q3. What does dots per inch (DPI) measure?

- (A) Number of bits
- (B) Density of the pixels on a computer screen**
- (C) The density of bits on a disk
- (D) Density of graphic files stored on a hard disk

Solution: (b) In printing, DPI (dots per inch) refers to the output resolution of a printer or imagesetter.

Q4. Which of the following input devices is user-programmable?

- (A) Dumb terminal
- (B) Smart terminal
- (C) Intelligent terminal**
- (D) VDT

Solution: The correct answer is option C. Intelligent terminal: a

computer operating terminal that can perform some data processing, as well as send and receive data to and from the central processor. Dumb terminal: a dumb terminal is a terminal that does not locally process entered information, but merely acts as an input/output device for an attached or network-linked processor. Smart terminal: a display terminal that provides keyboard input and screen output but does not perform business data processing. VDT: a Video Display Terminal (VDT) is a computer screen. A VDT displays computer-generated text and images.

Q5. Which of the following is the binary representation of "83"?

- (A) 1010011**
- (B) 1011011
- (C) 1011011
- (D) 1000111

Solution: The correct answer is option A. $83 \div 2 = 41 \times 2 + 1$, $41 \div 2 = 20 \times 2 + 1$, $20 \div 2 = 10 \times 2 + 0$, $10 \div 2 = 5 \times 2 + 0$, $5 \div 2 = 2 \times 2 + 1$, $2 \div 2 = 1 \times 2 + 0$, $1 \div 2 = 0 \times 2 + 1$. Thus, the correct binary representation of 83 in the binary system is 1010011.

Q6. Excel worksheet data can be shared with Word document by _____.

- (A) inserting an Excel file into Word
- (B) copy and paste Excel worksheet into Word document
- (C) link Excel data in a Word document
- (D) All of the above**

Solution: (d) You can bring the data from an Excel workbook into a word document in many ways. You can copy data from an open worksheet and paste it into a word document, import a worksheet into a new or existing table, or link to a worksheet from a word document.

Q7. Read this worksheet of MS-Excel 2010 carefully and accordingly choose the best suitable options for the question that follows. What is the absolute address of the cell containing the numeric value of 10?

- (A) \$B2\$
- (B) B2\$
- (C) \$B\$2**
- (D) &B2&

Solution: (c) The correct answer is \$B\$2. Absolute references are used when you want to fix a cell location. These cell references are preceded by a dollar sign.

Q8. Choose the correct answer from the options below:

- (A) A-III, B-IV, C-I, D-II
- (B) A-IV, B-III, C-I, D-II**
- (C) A-III, B-IV, C-II, D-I
- (D) A-IV, B-III, C-II, D-I

Solution: The correct answer is: A. 1 MB $\rightarrow$ (IV) 2^{20} Bytes. B. 1 GB $\rightarrow$ (III) 2^{30} Bytes. C. 1 TB $\rightarrow$ (I) 2^{40} Bytes. D. 1 KB $\rightarrow$ (II) 2^{10} Bytes. Explanation of the correct answer: 1 MB (Megabyte) equals 2^{20} bytes, which is approximately 1,048,576 bytes. 1 GB (Gigabyte) equals 2^{30} bytes, which is approximately 1,073,741,824 bytes. 1 TB (Terabyte) equals 2^{40} bytes, which is approximately 1,099,511,627,776 bytes. 1 KB (Kilobyte) equals 2^{10} bytes, which is approximately 1,024 bytes.

Q9. Which of the following cell references is default in MS Excel?

- (A) Relative**
- (B) Active
- (C) Absolute
- (D) Mixed

Solution: (a) By default, all cell references are relative references,

When copied across multiple cells, they change based on the relative position of rows and columns. Three kinds of cell references are Relative Cell References, Absolute Cell References, and Mixed Cell References.

Q10. You can use the Formula Palette in MS-Excel to

- (A) Format cells containing numbers
- (B) Create and edit formulas containing functions**
- (C) Enter estimate data
- (D) Copy a range of cells

Solution: The correct answer is option B. In MS-Excel, the Formula Palette lets you create and edit formulas containing functions. It provides a user-friendly interface for selecting and inserting functions, as well as assisting in entering arguments and parameters for those functions. This makes it easier to create complex calculations and formulas within Excel.

Q11. Where does a computer add, compare and shuffle data?

- (A) CPU chip**
- (B) Hard disc
- (C) Floppy disc
- (D) Memory chip

Solution: (a) CPU consists of a set of registers, arithmetic logic unit and control unit, which together interpret and execute instructions in assembly language. The primary functions of the CPU are as follows (i) The CPU transfers instructions and input data from main memory to registers, i.e. internal memory. (ii) The CPU executes the instructions in the stored sequence. (iii) When necessary, CPU transfers output data from registers to main memory.

Q12. Which PowerPoint feature lets a user create a simple presentation without spending too much time?

- (A) AutoContent Wizard**
- (B) Animation
- (C) Color scheme
- (D) Chart Wizard

Solution: The correct answer is option A. The AutoContent Wizard in PowerPoint helps users quickly create a simple presentation by providing predefined templates and structures. It helps users choose an appropriate design and layout for their content, such as title slides, content slides, and various themes. This feature is especially useful for users who want to create a presentation without investing too much time in the design and layout process.

Q13. Which type of network would use phone lines?

- (A) WAN**
- (B) LAN
- (C) WWAN
- (D) Wireless

Solution: (a) The user of a WAN usually does not own the communications lines that connect the remote computer systems; instead, the user subscribes to a service through a telecommunications provider. Local Area Network (LAN) can be defined as a collection of computers and peripherals interconnected within a limited geographical area.

Q14. Hexadecimal number system has a base.

- (A) 16**
- (B) 10
- (C) 8
- (D) 2

Solution: (a) It provides us with a shorthand method of working with binary numbers. There are 16 unique digits available in this system. These are 0 to 9 and A to F, where A denotes 10, B denotes 11,, F denotes 15.

Q15. Which of the following refers to a small, single-site network?

- (A) DSL

- (B) RAM
- (C) USB
- (D) PAN**

Solution: (d) A personal area network, or PAN, is a computer network organized around an individual person within a single building. It is called a small, single-site network. Universal Serial Bus (USB) is an industry standard that establishes specifications for cables, connectors and protocols for connection, communication and power supply (interfacing) between computers, peripherals and other computers. DSL (Digital Subscriber Line) is a modem technology that uses existing telephone lines to transport high-bandwidth data, such as multimedia and video, to service subscribers.

Q16. A collection of unprocessed items is:

- (A) Information
- (B) Data**
- (C) Memory
- (D) Report

Solution: The correct answer is option B. A collection of unprocessed facts, figures and symbols is called data. Information is the processed form of data, organized in a meaningful and useful way. Memory is the electronic space for holding instructions and data that the computer needs to access immediately — it is where information is stored for immediate use. Memory is one of the basic functions of a computer, since without it the computer would not be able to function properly. A report is a written or verbal account of something you have seen, heard, done, studied, etc.

Q17. Which type of virus attaches to EXE files, attacks and infects other EXE files along with the resulting infected EXE file?

- (A) Parasitic Virus**
- (B) Boot sector virus
- (C) Stealth Virus
- (D) Memory resident virus

Solution: The correct answer is option A. A parasitic virus is a type of virus that attaches itself to executable (EXE) files. Once the infected EXE file is executed, the virus code activates and can spread to other EXE files on the system. This type of virus attaches itself 'parasitically' to host files and uses them to spread and infect other files. A boot sector virus infects the boot sector of a storage device such as a hard drive or floppy disk — it typically affects the computer's boot process. A stealth virus is a type of virus that tries to hide itself from antivirus software and detection techniques, making it difficult to identify. A memory resident virus is a virus that installs itself in the computer's memory (RAM) and can infect files as they are opened or executed.

Q18. Which memory is not directly accessed by the CPU, but data is first loaded into RAM and then sent to the processor?

- (A) Volatile memory
- (B) RAM
- (C) Primary memory
- (D) Secondary memory**

Solution: The correct answer is option D. Secondary memory is a type of storage in a computer system that is not directly accessed by the CPU. Instead, data stored in secondary memory (such as hard drives, solid-state drives, CDs, DVDs, etc.) is first loaded into RAM (primary memory) before being processed by the CPU. Secondary memory is used for long-term storage of data and programs, while primary memory (RAM) is used for temporary storage of data the CPU is currently working with.

Q19. A worm _____

- (A) can only be transferred with human intervention
- (B) worms are harmless
- (C) worms are not self replicating
- (D) can automatically move in network**

Solution: (d) Worms are a self-replicating type of malware (and a type of virus) that enter networks by exploiting vulnerabilities,

moving automatically from one computer to another.

Q20. A typical university or corporate LAN that includes one or more servers and clients is called a ____.

- (A) Master slave network
- (B) Peer-to-peer
- (C) Client server network**
- (D) LAN

Solution: (c) A client-server network is a communications model in which multiple client programs share the services of a common server program. Peer-to-peer → In a P2P network, computing devices use software to connect with each other over a private network, such as a home local area network (LAN) or a public network, such as the Internet. Master slave network → Master slave is a model of communication for hardware devices where one device has a unidirectional control over one or more devices.

Q21. SERP stands for:

- (A) Search Engine Review Page
- (B) Search Engine Result Preview
- (C) Search engine Review Preview
- (D) Search engine Results Page**

Solution: The correct answer is option D. Search Engine Results Pages (SERP) are the pages displayed by a search engine in response to a query asked by a user. The main component of a SERP is the list of results returned by the search engine in response to a keyword query.

Q22. In a standard keyboard, the Ctrl, Shift and Alt keys are called:

- (A) Adjustment keys
- (B) Function keys
- (C) Modifier keys**
- (D) Alphanumeric keys

Solution: The correct answer is option C. Ctrl, Shift and Alt are called modifier keys.

Q23. The of a threat measures its potential impact on a system.

- (A) vulnerabilities
- (B) counter measures
- (C) degree of harm**
- (D) susceptibility

Solution: (c) The negative consequence of an actualized threat is harm.

Q24. Which IT area is well-established in Accounting?

- (A) Multimedia system
- (B) Statistical analysis
- (C) Accounting Information Systems**
- (D) Web development

Solution: (c) An accounting information system (AIS) is a structure that a business uses to collect, store, manage, and report its financial data so it can be used by accountants and tax agencies. Multimedia system → Any computer delivered electronic system that presents information through different media that may include text, sound, video computer graphics, and animation. Statistical analysis → It's the science of collecting, exploring and presenting large amounts of data to discover underlying patterns and trends. Web development → Web development refers to the creating, building, and maintaining of websites.

Q25. Which of the following is true about Java?

- (A) It is an OOP language
- (B) It is Platform Independent
- (C) It provides more security
- (D) All the above**

Solution: (b) Java is a widely used object-oriented programming

language and software platform that runs on billions of devices. Java is a platform-independent language, meaning we run the same code on multiple platforms. The Java language itself is type-safe and provides automatic garbage collection, enhancing the robustness of application code.
