Q1. In which of the following e-banking methods is the minimum transaction value 2 lakh?

- (A) NEFT
- (B) RTGS**
- (C) ECS
- (D) IMPS

Solution: The correct answer is option B. Real Time Gross Settlement (RTGS): continuous settlement of funds individually on an order basis (without netting). This means processing instructions as they are received, rather than at a later time. Settlement of funds happens in the books of the Reserve Bank of India, so they are final and irrevocable. The system is for high-value transactions (minimum amount is 2 lakh). National Electronic Fund Transfer (NEFT): a nationwide payment system facilitating one-to-one funds transfer. Individuals, firms and corporates can electronically transfer funds from any bank to any individual, firm or corporate. Even individuals without a bank account (walk-in customers) can deposit cash to transfer funds using NEFT at NEFT-enabled branches. NEFT stands for National Electronic Fund Transfer, maintained by the Government of India and RBI, and the process takes about 2 hours. Electronic Clearing System (ECS): an alternative method for effecting payment transactions related to utility bill payments such as telephone bills, electricity bills, etc., eliminating the need for issuing and handling paper instruments, thereby facilitating better customer service for banks/companies/corporations/government departments, etc. Immediate Payment Service (IMPS): provides instant, 24x7, interbank electronic fund transfer service through mobile phones — a powerful tool to instantly transfer funds within banks across India through mobile, internet and ATM, which is not only secure but also economical from both financial and non-financial perspectives.

Q2. Which networking device operates at Layer 2 of the OSI model and forwards data based on MAC addresses?

- (A) Firewall
- (B) Hub
- (C) Router
- (D) Switch**

Solution: The correct answer is (d) Switch.

Q3. Combination bridge and router is called as ____ .

- (A) Switch
- (B) Brouter**
- (C) Packet
- (D) Socket

Solution: (b) A bridge router or brouter is a network device that works as a bridge and as a router. The brouter routes packets for known protocols and simply forwards all other packets as a bridge would. Switch → A network switch connects devices (such as computers, printers, wireless access points) in a network to each other, and allows them to 'talk' by exchanging data packets. Packet → In networking, a packet is a small segment of a larger message. Data sent over computer networks*, such as the Internet, is divided into packets. Socket → A socket is one endpoint of a two way communication link between two programs running on the network.

Q4. _____ is a keyboard shortcut for spell check in MS-PowerPoint.

- (A) F7**
- (B) Ctrl + P
- (C) F12
- (D) F2

Solution: The correct answer is option A.

Q5. Which language is directly understood by the computer without a translation Program?

- (A) Machine language**
- (B) C# Language
- (C) High level language
- (D) C language

Solution: (a) Machine language is directly understood by the computer without a translation Program. Machine language is the language understood by a computer. It is very difficult to understand, but it is the only thing that the computer can work with. C# Language → C# enables developers to build many types of secure and robust applications that run in . NET. High level language → A high-level language is any programming language that enables development of a program in a much more user-friendly programming context and is generally independent of the computer's hardware architecture. C language → The C programming language is a general-purpose, operating system-agnostic, and procedural language that supports structured programming and provides low-level access to the system memory.

Q6. What is the other name for 'transistor computer' ?

- (A) First Generation Computer
- (B) Third Generation Computer
- (C) Second Generation Computer**
- (D) Fourth Generation Computer

Solution: (c) First Generation: 1946-1959. Vacuum tube-based. Second Generation: 1959-1965. Transistor-based. Third Generation: 1965-1971. Integrated Circuit based. Fourth Generation: 1971-1980. VLSI microprocessor-based. Fifth Generation: 1980-onwards. ULSI microprocessor-based.

Q7. Under which tab is the indent option available in an MS Word 2007 document?

- (A) Insert
- (B) Home
- (C) Page Setup
- (D) Page Layout**

Solution: (d) Under page layout tab the indent option available in an MS Word 2007 document.

Q8. The phrase 'computer graphics' was introduced in 1960 by _____, a graphic designer at Boeing.

- (A) John Taylor
- (B) Michael Noll
- (C) Steven Balmer
- (D) William Fetter**

Solution: The correct answer is option D. The phrase 'computer graphics' was introduced in 1960 by William Fetter, a graphic designer who worked for Boeing. Fetter is also known for his work in developing the concept of computer-generated three-dimensional (3D) graphics for use in aviation design and other applications.

Q9. What is the full form of 'MAN'?

- (A) Man Area Network
- (B) Meter Area Network
- (C) Metropolitan Area Network**
- (D) Manage Area Network

Solution: (c) MAN is a Metropolitan Area Network. It is a computer network that connects multiple local area networks within a metropolitan area.

Q10. Which of the following keyboard shortcuts is used to switch between open applications in a Windows 10 system?

- (A) Alt + S
- (B) Ctrl + S
- (C) Ctrl + Tab

(D) Alt + Tab

Solution: The correct answer is (d) Alt + Tab. In Windows 10, this shortcut is used to switch between open applications — pressing this combination lets you cycle through open windows/applications. Alt + S is not used for switching applications in Windows 10. Ctrl + S is used to save the current document in many applications. Ctrl + Tab is used to switch between tabs within an application (like a browser or text editor), not between open applications.

Q11. Which one is used to check the condition based on group functions?

- (A) Where clause
- (B) As clause
- (C) Having clause**
- (D) Both A and B

Solution: (c) Having clause → A HAVING clause in SQL specifies that an SQL SELECT statement must only return rows where aggregate values meet the specified conditions. Where clause → In a SQL statement, the WHERE clause specifies criteria that field values must meet for the records that contain the values to be included in the query results. As clause → The AS command is used to rename a column or table with an alias.

Q12. Which of the following is required for WAN hardware?

- (A) Bridge
- (B) Switch
- (C) Router**
- (D) Firewall

Solution: The correct answer is option C. A router is essential for WAN (Wide Area Network) hardware. A WAN is a network that spans a large geographic area and connects several smaller networks or LANs (Local Area Networks). Routers are devices that operate at the network layer of the OSI model and are responsible for forwarding data between different networks. They determine the best path for data to travel from the source network to the destination network in a WAN environment. Routers play an important role in interconnecting different LANs to create a WAN.

Q13. What will the following function return in MS-Excel 2010? =MATCH(12,{10,13,30,40,60},1)

- (A) 0
- (B) #N/A
- (C) 2
- (D) 1**

Solution: The correct answer is (d) 1. The MATCH function in Excel returns the relative position of a value in an array, depending on the specified match type. Syntax: =MATCH(lookup_value, lookup_array, match_type). lookup_value: the value to search for (here, 12). lookup_array: the array to search in ({10, 13, 30, 40, 60}). match_type: 1 — assuming the array is in ascending order, finds the largest value less than or equal to the lookup_value. In the given function: the lookup value is 12. The array {10, 13, 30, 40, 60} is in ascending order. match_type is 1. The function finds the largest value less than or equal to 12. The closest value is 10, which is at position 1. So, the function will return 1.

Q14. Which of the following is NOT an input device?

- (A) Light pen
- (B) Plotter**
- (C) Track ball
- (D) Microphone

Solution: The correct answer is option B. A plotter is an output device. Plotters are used to create hard copies of graphics and designs on paper, often used in engineering, architecture and design applications. It works by drawing lines on paper based on digital commands, but it does not take input directly from the user like a traditional input device. A light pen is an input device that was used with some older computer systems. It is a handheld device with a light-sensitive detector at the tip. Users can point the light pen at the screen to interact with the computer by selecting items on the screen.

When the pen's tip touches the screen, the computer can detect the position and act accordingly. A trackball is an input device similar in function to a computer mouse but with a stationary ball on top. The user rotates the ball to control cursor movement on the screen. A trackball doesn't require the user to move the entire device like a mouse — instead, only the ball is rotated. It is used to point at and interact with the computer, so it is an input device. A microphone is an input device that converts sound waves into electrical signals. It is used to input audio into a computer system, such as for voice recording, video conferencing and various audio applications. The user speaks into the microphone, and the computer processes the audio input.

Q15. What is the default size of the data type in MS-Access ?

- (A) 50**
- (B) 60
- (C) 70
- (D) 80

Solution: (a) 50 is the default data size.

Q16. Which of the following Google Chrome browser privacy and security settings uses cookies to remember preferences, even if we don't visit those pages?

- (A) Sync and Google services
- (B) Clear browsing data
- (C) Manage certificates
- (D) Preload pages for faster browsing and searching**

Solution: The correct answer is (d). Preload pages for faster browsing and searching: this setting in Google Chrome uses cookies to remember your preferences and preloads pages you might visit next. This helps speed up your browsing experience, since it loads pages in the background even if you don't immediately visit those pages. Sync and Google services: this setting lets you sync your bookmarks, history, passwords and other settings across devices using your Google account. It doesn't specifically use cookies to remember preferences for preloading pages. Clear browsing data: this option lets you delete your browsing history, cookies, cached images and other data. It's used for privacy and has no connection to preloading pages. Manage certificates: this setting is used to manage security certificates for secure websites. It doesn't involve remembering preferences using cookies or preloading pages.

Q17. Which one defines how the data are actually stored and organized on the storage medium?

- (A) Physical level**
- (B) Logical level
- (C) View level
- (D) Conceptual level

Solution: (a) In computers, a storage medium is a physical device that receives and retains electronic data for applications and users and makes the data available for retrieval.

Q18. The application layer is the ____ layer of the OSI model.

- (A) 1
- (B) 3
- (C) 4
- (D) 7**

Solution: The correct answer is option D. The application layer is the seventh and topmost layer of the OSI (Open Systems Interconnection) model. It is responsible for providing application services, interfaces and protocols so software applications can interact with the network and communicate with other devices. This layer deals with the user interface, data exchange, and application-level protocols such as HTTP for web browsing, SMTP for email, and FTP for file transfer.

Q19. Which of the following statements is INCORRECT with reference to workbooks in MS Excel?

- (A) A workbook is made up of worksheets.
- (B) Worksheets are labeled Sheet1, Sheet2 and Sheet3 and so on.

(C) The name of a worksheet cannot be changed in MS Excel.

(D) Each Microsoft Excel worksheet is made up of columns and rows.

Solution: (c) In Microsoft Excel, a workbook is a collection of one or more spreadsheets, also called worksheets. In a single file each workbook maintains a collection of worksheets that allows to add and delete worksheets. It also allows to move worksheets within the workbook or simply iterate through them. A worksheet consists of cells organized into columns and rows.

Q20. Which of the following is the type of software that has self-replicating software that causes damage to files and systems?

(A) Worms

(B) Viruses

(C) Trojan horses

(D) Bots

Solution: (a) A computer worm is a type of malware whose primary function is to self-replicate and infect other computers while remaining active on infected systems. Computer virus → It is a malicious piece of computer code designed to spread from device to device. Trojan horse/virus → It can be a program that purports to do one action when, in fact, it is performing a malicious action on your computer. Bots → A bot is a software program that performs automated, repetitive, predefined tasks. Bots typically imitate or replace human user behavior. Because they are automated, they operate much faster than human users.

Q21. In Computer terminology, what is a nibble?

(A) Half a byte

(B) A kilobyte

(C) A gigabyte

(D) A terabyte

Solution: (a) A nibble is a four-bit aggregation or half an octet (byte). 1 Nibble = 4 bit. Extra facts :- 1 Kilobyte :- 1024 bytes (210 byte) 1 gigabyte (GB) :- 1,024 megabytes (MB) 1 terabyte (TB) :- 1,024 gigabytes.

Q22. 14 In which of the following communication types, data can be sent in one direction only?

(A) Halfplex

(B) Simplex

(C) Duplex

(D) Half-Duplex

Solution: (b) Simplex → Simplex is a communications mode in which only one signal is transmitted, and it always goes in the same direction for e.g. radio broadcasting, television broadcasting. Duplex → A duplex communication system is a point-to-point system composed of two or more connected parties or devices that can communicate with one another in both directions for e.g. a telephone call where both parties can communicate at the same time. Half-Duplex → Half-duplex data transmission means that data can be transmitted in both directions on a signal carrier, but not at the same time for e.g. An example of a half-duplex device is a walkie-talkie.

Q23. Testing an already existing large database to obtain new useful information, in the context of information technology. This process is called-

(A) Simulating

(B) Mining

(C) Resourcing

(D) Having

Solution: The correct answer is (b) Mining. Data mining refers to analyzing large sets of data (often from existing databases) to identify patterns, trends or new insights, using techniques like statistical analysis, machine learning and data visualization. Simulating means creating models to replicate real-world processes, not analyzing datasets for new information. Resourcing refers to allocating/managing resources. 'Having' is not a relevant IT term.

Q24. The binary number 10101 is equivalent to decimal number

(A) 21

(B) 12

(C) 27

(D) 19

Solution: (a) Step 1: Write down the binary number: 10101 Step 2: Multiply each digit of the binary number by the corresponding power of two: $1 \times 2^4 + 0 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0$ Step 3: Solve the powers: $1 \times 16 + 0 \times 8 + 1 \times 4 + 0 \times 2 + 1 \times 1 = 16 + 0 + 4 + 0 + 1$ Step 4: Add up the numbers written above: $16 + 0 + 4 + 0 + 1 = 21$. So, 21 is the decimal equivalent of the binary number 10101.

Q25. What will be the result of the following MS Excel formula? =FACT(0) + FACT(3) + FACT(5)

(A) 127

(B) 8

(C) 126

(D) 9

Solution: (a) The result of =FACT(0) + FACT(3) + FACT(5) is 127. The Excel FACT function returns the factorial of a given number.
