Q1. In the context of computers, GUI stands for:

- (A) Gigabyte used in internet
- (B) Group user interface
- (C) Graphical user investigation
- (D) Graphical user interface**

Solution: The correct answer is option D. A Graphical User Interface (GUI) is a digital interface in which a user interacts with graphical components such as icons, buttons, and menus. In a GUI, the visuals displayed in the interface can convey relevant information to the user, as well as represent the actions they can take.

Q2. 'StrandHogg', which was in the news in December 2019, is:

- (A) Malware for the Android operating system**
- (B) Israel's super-sonic missile
- (C) A satellite launched by NASA
- (D) Anti-virus software developed by Microsoft

Solution: The correct answer is option A. 'StrandHogg' is a term used to describe a vulnerability or security issue affecting the Android operating system. In December 2019, it was reported that a vulnerability in Android OS allowed malicious apps to present themselves as legitimate apps and request sensitive permissions, potentially leading to various types of attacks or data theft. This issue could allow attackers to trick users into granting permissions to malicious apps, leading to serious security risks.

Q3. Which one is a typical rectangular shaped monitor that you see on a desktop computer?

- (A) LCD**
- (B) CRT
- (C) LED
- (D) BIOS

Solution: (a) A cathode-ray tube (CRT) is a specialized vacuum tube in which images are produced when an electron beam strikes a phosphorescent surface. LCD → LCD (Liquid Crystal Display) is a type of flat panel display which uses liquid crystals in its primary form of operation. LED → A LED display is a flat panel display that uses an array of light-emitting diodes as pixels for a video display. BIOS → BIOS, or Basic Input/Output System, is the built-in core processor software responsible for booting up your system. Typically embedded into your computer as a motherboard chip, the BIOS functions as a catalyst for PC functionality action.

Q4. Choose the wrong option in relation to cell:

- (A) Any information you enter in a spreadsheet will be stored in a cell.
- (B) Cells can contain text, such as letters, numbers but not dates.**
- (C) Cells can contain text, such as letters, numbers, and dates.
- (D) Cells can contain formatting attributes that change the way letters, numbers, and dates are displayed.

Solution: (b) In Ms Excel String variables which are also called alphanumeric variables or character variables have values that are treated as text. This means that the values of string variables may include numbers, letters, or symbols. Excel stores dates as sequential serial numbers so that they can be used in calculations. By default, January 1, 1900 is serial number 1, and January 1, 2008 is serial number 39448 because it is 39,447 days after January 1, 1900.

Q5. Which of the following is the full form of GPRS?

- (A) General Packet Radio Service**
- (B) General Protocol Radio Service
- (C) General Packet Release Service
- (D) Group Packet Radio Service

Solution: The correct answer is (a). GPRS's full name is General Packet Radio Service. Explanation: General Packet Radio Service (GPRS): GPRS is a packet-oriented mobile data standard on 2G and 3G cellular communication networks. It allows transmission of data over mobile networks, enabling services like internet browsing, email, and multimedia messaging (MMS). How GPRS works: unlike traditional circuit-switched data services, GPRS uses packet switching, meaning data is broken into packets before being transmitted. This allows more efficient use of network resources and provides higher data rates. Applications of GPRS: GPRS is used for various mobile internet applications including web browsing, file transfer and instant messaging. It also supports location-based services and mobile commerce.

Q6. Cupcake, Donut, Eclair, Froyo and Gingerbread are codenames for different _____ versions ?

- (A) Piano
- (B) Android**
- (C) Computer
- (D) Ca

Solution: (b) Cupcake, Donut, Eclair, Froyo and Gingerbread are code names for different Android versions.

Q7. In information and technology, what does ASCII stand for in English?

- (A) American Standard Communication For Information
- (B) American Standard Code For Information Interchange**
- (C) American Standard Code For Infrastructure Interchange
- (D) American Standard ode For International Interchange

Solution: The correct answer is: b. ASCII stands for American Standard Code for Information Interchange. It is a character encoding standard used in electronic communication. ASCII codes represent text in computers, telecommunications equipment and other devices. The original ASCII set includes 128 code points, of which only 95 are printable characters. These characters significantly influenced the design of character sets used by modern computers, including Unicode, which extends beyond ASCII but shares its first 128 code points. The Internet Assigned Numbers Authority (IANA) prefers the name US-ASCII for this character encoding.

Q8. Which networking device operates at Layer 2 of the OSI model and forwards data based on MAC addresses?

- (A) Firewall
- (B) Hub
- (C) Router
- (D) Switch**

Solution: The correct answer is (d) Switch. A switch operates at Layer 2 (Data Link Layer) of the OSI model, forwarding data packets based on MAC addresses that identify specific devices on a network. Switches are more efficient than hubs because they direct data to the correct destination, reducing network traffic and improving performance.

Q9. Which of the following statements is/are true? (i) In MS Word, the default alignment of text is 'left'. (ii) In MS Word, every paragraph ends with a paragraph mark, which looks like a backward P(¶).

- (A) Neither i nor ii
- (B) Both i and ii**
- (C) Only i
- (D) Only ii

Solution: (b) In MS Word, the default alignment of text is 'left'. There are four types of paragraph alignment available in Microsoft Word — left-aligned, center-aligned, right aligned, and justified. In MS Word, every paragraph ends with a paragraph mark, which looks

like a backward P(¶).

Q10. What is a named area on a disk that is used to store related subfolders and files called?

- (A) desktop
- (B) folder**
- (C) menu
- (D) Safari

Solution: (b) A folder is a virtual location where programs, files, and other folders can be located.

Q11. In MS Word, which feature lets you create different headers and footers for odd and even pages in a document?

- (A) Section Break
- (B) Different First Page
- (C) Page Break
- (D) Different Odd and Even Pages**

Solution: The correct answer is: d. In Microsoft Word, the feature that lets you create different headers and footers for odd and even pages in a document is 'Different Odd and Even Pages'. Here's how you can use it: Open your Word document. Double-click the header or footer area to activate it. In the Header & Footer Tools tab, check the 'Different Odd & Even Pages' checkbox. Now you can customize the headers and footers separately for odd and even pages. For odd pages, edit the header or footer content as needed. Switch to an even page and customize its header or footer. Close the header and footer toolbar or press Esc to exit. This feature is useful for creating professional-looking documents with different headers and footers on alternating pages.

Q12. _____ is a computer, appliance or router that sits between a trusted and an untrusted system.

- (A) Hub
- (B) Switch
- (C) Firewall**
- (D) Bridge

Solution: The correct answer is (c). Firewall: a firewall is a security system designed to protect a network by filtering traffic and blocking or allowing data packets based on security rules. It acts as a barrier between a trusted internal network and an untrusted external network (like the internet), and helps prevent unauthorized access and cyber threats. Other options: Hub — a hub is a basic networking device used to connect multiple computers or devices in a network. It operates at the physical layer (Layer 1) of the OSI model and broadcasts data to all connected devices. Switch — a switch is a network device that operates at the data link layer (Layer 2) of the OSI model. It connects multiple devices on a network and forwards data only to the device it's intended for, based on MAC addresses. Switches are more efficient than hubs. Bridge — a bridge is a networking device that connects and filters traffic between two or more network segments, operating at the data link layer (Layer 2). It helps reduce network traffic and forwards only relevant data. Bridges are used to extend networks.

Q13. _____ is used in MS-Excel 2010 to open an already existing file.

- (A) SAVE
- (B) SAVE AS
- (C) NEW
- (D) OPEN**

Solution: (d) Open → It is used to open an existing document. Save → It Saves the active document. Save As → It is used when you want to change the name, location and format of the document. New → It is used to create a new document.

Q14. Code 'EBCDIC' that is used in computing stands for

- (A) Extension BCD Information Code
- (B) Extension BCD Interchange Conduct
- (C) Extended BCD Interchange Conduct

(D) Extended BCD Information Code

Solution: (d) The correct answer is Extended BCD Information Code.

Q15. A(n) _____ is a set of programs designed to manage the resources of a computer, including starting the computer, managing programs, managing memory and coordinating tasks between input and output devices.

- (A) Application suite
- (B) Compiler
- (C) Input/output system
- (D) Operating system (OS)**

Solution: (d) Operating system (OS) ♦♦♦ An operating system (OS) is the program that, after being initially loaded into the computer by a boot program, manages all of the other application programs in a computer. Application suite ♦♦♦ A application suite is as a group of different but interrelated software programs that are combined and packaged together. Compiler ♦♦♦ A program that converts instructions into a machine-code or lower-level form so that they can be read and executed by a computer. Input/output system ♦♦♦ I/O (Input/Output) is an information processing system designed to send and receive data from a computer hardware component, device, or network. Data can be sent between devices over a network.

Q16. Which of the following refers to too much electricity and can cause a voltage surge?

- (A) Anomaly
- (B) Shock
- (C) Spike**
- (D) Virus

Solution: The correct answer is option C. In the context of electricity and electronics, a spike refers to a sudden and momentary rise in voltage, also known as a voltage spike or surge. Voltage spikes can be caused by various factors, such as lightning strikes, fluctuations in the power grid, or sudden changes in electrical load. These spikes can potentially damage electronic equipment and components if they are not adequately protected against.

Q17. The scanner can scan a document or image by _____.

- (A) Document by Document
- (B) Line by line
- (C) Pixel by Pixel**
- (D) Paragraph by Paragraph

Solution: (c) Scanners work by converting the image on the document into digital information that can be stored on a computer through optical character recognition (OCR). This process is done by a scanning head, which uses one or more sensors to capture the image as light or electrical charges.

Q18. Which of the following will show clearer image quality?

- (A) QHD
- (B) UHD**
- (C) HD
- (D) FHD

Solution: The correct answer is option B. Resolution refers to the number of pixels a screen can display. The more pixels a screen can show, the sharper the image quality. Baseline Full HD features 1,920 x 1,080 pixels (1080p), with sharper standards being QHD (2,560 x 1,440 pixels) and 4K UHD (3,840 x 2,160 pixels). The higher the resolution of a monitor, the more detailed the image can be, because a higher-resolution monitor is made up of more pixels closer together than a lower-resolution monitor.

Q19. Which of the following provides process and memory management services that allow two or more tasks, jobs or programs to run simultaneously.

- (A) Multithreading
- (B) Multiprocessing

- (C) Multicomputing
(D) **Multitasking**

Solution: (d) In this operating system, more than one process can be executed concurrently. It also allows the user to switch between the running applications. e.g. Linux, Unix, Windows 95.

Q20. Which of the following deals with the design, construction, operation and use of robots?

- (A) Artificial Intelligence
(B) Nano computer
(C) **Robotics**
(D) Quantum computer

Solution: (c) Robotics is the branch of engineering and science that deals with the design, construction, operation and use of robots as well as computer systems for their control, sensory feedback and information processing. Artificial Intelligence (AI) is an area of computer science that emphasizes the creation of intelligent machines that work and react like humans. e.g. learning, planning etc. Quantum computing is a type of computation whose operations can harness the phenomena of quantum mechanics, such as superposition, interference,

Q21. The mails deleted from the Inbox will be saved in, which of the following places?

- (A) Draft
(B) **Trash**
(C) Outbox
(D) All Mail

Solution: (b) Emails that are deleted from a folder are not completely gone. Deleted emails are usually stored for a defined time in the trash folder. Draft → Drafts represent unsent messages with the DRAFT system label applied. The message contained within the draft cannot be edited once created, but it can be replaced. Outbox → The Outbox is a temporary folder that holds your outgoing emails if there are any issues sending the message until they can be sent.

Q22. Which of the following is not responsible for the performance of the computer?

- (A) **number of keys in the keyboard**
(B) format of the video/graphics word
(C) memory in the video/graphics word
(D) the clock speed of the processor

Solution: (a) The performance of a computer does not depend on the number of keys in the keyboard.

Q23. Which of the following characters must be a part of an email id?

- (A) Dot (.)
(B) Dollar (\$)
(C) Ampersand (&)
(D) **At the rate (@)**

Solution: (d) Electronic mail (e-mail) is a method of exchanging messages ("mail") between people using electronic devices. Every email address consists of 3 elements: local-part, @ symbol (pronounced as "at"), and domain name. The local-part is placed before the @ symbol, and the domain name is placed after the @ symbol. Raymond Samuel Tomlinson created the first email on the ARPANET system.

Q24. Which of the following statements is false regarding email forwarding?

- (A) It is possible to delete existing attachments while forwarding an e-mail
(B) While forwarding an e-mail it is possible to forward multiple recipients at once
(C) When forwarding an e-mail, it is possible to add a message or edit an existing message
(D) **While forwarding an e-mail, it is not possible to delete the**

existing attachment.

Solution: (d) While forwarding an e-mail, it is possible to delete the existing attachment. So, Option D is false.

Q25. What does 'Grammar' checking in Microsoft Word 365 mainly focus on? I. Spelling errors II. Sentence structure and syntax

- (A) **Both I and II**
(B) Only II
(C) Only I
(D) Neither I nor II

Solution: The correct answer is (a) Both I and II. Explanation: In Microsoft Word 365, the grammar check tool indeed addresses both spelling errors (I) and sentence structure and syntax (II). It checks sentences for grammatical issues, such as punctuation, sentence fragments and incorrect syntax, while also detecting spelling mistakes.
