Q1. A Blu-ray disc is-

- (A) A music device
- (B) A medical device
- (C) A data storage system**
- (D) An educational kit

Solution: The correct answer is (c) Data storage system.

Explanation: Data storage system: A Blu-ray disc is a digital optical disc storage format, primarily used to store high-definition video and large amounts of data. With a capacity of up to 50 GB on a dual-layer disc, Blu-ray is commonly used for movies, video games and other data-intensive applications. Music device: while Blu-ray discs can store music, they are not specifically music devices — they are a medium of data storage. Medical device: Blu-ray discs have no specific medical function and are not classified as medical devices. Educational kit: although educational content can be stored on a Blu-ray disc, they are not classified as an educational kit; they are simply a storage format.

Q2. Which software is more useful for presentations in a classroom?

- (A) Microsoft Access
- (B) Microsoft Excel
- (C) Microsoft PowerPoint**
- (D) Microsoft Word

Solution: The correct answer is (c) Microsoft PowerPoint.

PowerPoint is specifically designed for creating presentations with slides, making it most suitable for classroom presentations, allowing structured display of text, images, video and animations to enhance the learning experience. Microsoft Access is mainly used for managing databases. Microsoft Excel is used for data analysis and spreadsheets. Microsoft Word is ideal for word processing but lacks the visual tools for creating engaging presentations like PowerPoint.

Q3. A service that allows us to send messages in in electronic mode over the internet with a unique address. It offers an efficient, inexpensive, and real-time means of distributing information among people.

- (A) VLOG
- (B) Videoconferencing
- (C) BLOG
- (D) EMAIL**

Solution: (d) Electronic mail (e-mail) is a computer-based application for the exchange of messages between users. A worldwide email network allows people to exchange e-mail messages very quickly.

Q4. Which of the following will convert all the source code into machine code, creating an executable file?

- (A) Linker
- (B) Assembler
- (C) Compiler**
- (D) Interrupter

Solution: (c) A compiler is a special program that translates a programming language's source code into machine code, bytecode or another programming language.

Q5. What type of device is a computer monitor?

- (A) Software
- (B) Processing
- (C) Input
- (D) Output**

Solution: (d) A computer monitor is an output device that displays information in pictorial or textual form.

Q6. Which of the following is an example for an embedded system?

- (A) ROM
- (B) RAM
- (C) ATM**
- (D) Machine

Solution: (c) An ATM is an embedded system which utilizes a crowded computer to set up a network between a bank computer and an ATM itself. ROM → ROM (read-only memory) is a non-volatile memory type. This means it receives data and permanently writes it on a chip, and it lasts even after you turn off your computer. RAM → RAM is used for immediate data storage and retrieval. RAM can process information significantly faster than data on a hard disk.

Q7. Error messages in an Excel sheet start with _____ sign/symbol.

- (A) %
- (B) \$
- (C) #**
- (D) =

Solution: (c) The ##### error is one of the most common errors that appear when using Excel, and it's easy to fix.

Q8. Who invented the QWERTY keyboard style used for computers and typewriters?

- (A) Michael Blumberg
- (B) William Singletary
- (C) Edward Rosewater
- (D) Christopher Latham Sholes**

Solution: The correct answer is option D. Christopher Latham Sholes was an American inventor who invented the QWERTY keyboard, and along with Samuel W. Soule, Carlos Glidden and John Pratt, is considered one of the inventors of the first typewriter in the United States.

Q9. A topology for a Local Area Network in which all nodes are individually connected to a central connection point like a hub or switch is called:

- (A) star topology**
- (B) tree topology
- (C) ring topology
- (D) bus topology

Solution: (a) A topology for a Local Area Network in which all nodes are individually connected to a central connection point like a hub or switch is called star topology.

Q10. _____ is a telecommunications network or computer network that spans a large geographical distance.

- (A) Uniform Resource Locator
- (B) Simple Mail Transfer Protocol
- (C) Wide Area Network**
- (D) JavaScript

Solution: The correct answer is: c. 1. Wide Area Network (WAN): a Wide Area Network (WAN) is a telecommunications network or computer network that spans a large geographic area. It connects smaller networks (like local area networks or metropolitan area networks) which may span across various cities, countries, or even continents. Using a WAN, data can be exchanged between different locations, helping organizations communicate effectively despite physical distance. 2. Uniform Resource Locator (URL): a URL is a web address that specifies the location of a resource on the internet. It includes a protocol (like 'http' or 'https'), a domain name (like 'example.com'), and an optional path (like '/page'). 3. Simple Mail

Transfer Protocol (SMTP): SMTP is a protocol used to send and receive email messages. It handles the transmission of email between mail servers. 4. JavaScript: JavaScript is a widely used programming language for web development. It's used in web browsers and helps create interactive and dynamic web pages.

Q11. In the context of digital certificates, SSL stands for?

- (A) Standard Socket Layer
- (B) Secure Service Layer
- (C) Secure Socket Layer**
- (D) Secure Service Line

Solution: The correct answer is option C. In the context of digital certificates, SSL stands for Secure Socket Layer. SSL is a cryptographic protocol used to establish a secure and encrypted connection between a client (such as a web browser) and a server. It ensures that data transmitted between both parties is encrypted and protected from eavesdropping and tampering. However, please note that SSL has largely been deprecated in favour of its successor, Transport Layer Security (TLS), which offers a more secure and up-to-date encryption protocol.

Q12. Nowadays, the CPU can be implemented on a single microchip called:

- (A) GPU
- (B) RAM
- (C) Motherboard
- (D) Microprocessor**

Solution: The correct answer is option D. A microprocessor is a Central Processing Unit (CPU) designed as a complete processing unit on a single integrated circuit (microchip). It functions as the computer's 'brain', taking instructions from programs and performing arithmetic and logic operations. In modern computing, microprocessors have advanced to the point where they can house millions or billions of transistors on a single chip — this lets them handle complex tasks, execute instructions quickly, and efficiently manage various hardware and software processes. A GPU (Graphics Processing Unit) is responsible for rendering graphics and handling image-processing tasks — while GPUs are also implemented on microchips, they serve a different purpose than CPUs. RAM (Random Access Memory) is a type of volatile memory that provides temporary storage for data currently being used by the CPU — it is not the same as a microprocessor. A motherboard is the computer's main circuit board, which connects various hardware components — it does not refer to the microchip that contains the CPU.

Q13. A computer does not suffer from fatigue and lack of concentration. This is known as _____

- (A) Diligence**
- (B) Versatility
- (C) GIGO
- (D) None of the above

Solution: The correct answer is option A. The computer's ability to perform repetitive tasks without getting tired is called diligence. A computer is free from fatigue, lack of concentration, exhaustion, etc., so it can work for hours without producing any errors. Versatility refers to the computer's ability to perform a variety of tasks, simple as well as complex. Computers are generally versatile unless designed for a specific application. GIGO means Garbage In Garbage Out. It refers to the idea that in any system, the quality of output is determined by the quality of input. For example, if a mathematical equation is stated improperly, the answer is unlikely to be correct.

Q14. Which of the following is NOT a softcopy device?

- (A) Monitor
- (B) Plotter**
- (C) Projector
- (D) Speaker

Solution: The correct answer is option B. A monitor is a softcopy

device. It displays digital content such as text, images and video on screen. The displayed content is not physical but electronically visible. A plotter is not a softcopy device. It is a physical output device that produces hardcopy output on paper or other materials. Plotters are often used to create large-format drawings, maps and other visual representations. A projector is a softcopy device. It projects digital content onto a screen or surface, letting other people view the displayed content. The projected image is not a physical print but a visual representation. A speaker is a softcopy device. Although it doesn't display visual content, it plays audio output from digital sources. It electronically reproduces sound, which is a form of softcopy representation.

Q15. Which of the following shortcut keys is used to close the current or active window?

- (A) Alt+F4**
- (B) Ctrl+F4
- (C) Alt+F6
- (D) Ctrl+F6

Solution: (a) Pressing the Alt + F4 keys together is a keyboard shortcut to close the currently active window. Ctrl + F4 is used to close the active document. Alt + F6 is used for switching among top-level windows in an application. We use Ctrl + F6 for switching windows.

Q16. Which of the following methods is used to open a word processing package?

- (A) Start->All Programs->Microsoft Word**
- (B) File-> All Programs->Microsoft Word
- (C) File-> All Programs->Word Processor
- (D) Start->All Programs->Word Processor

Solution: The correct way to open a word processing package like Microsoft Word is: (a) Start -> All Programs -> Microsoft Word. Here's why: In most Windows operating systems, you click Start to open an application, then navigate to All Programs or All Apps and select the application (like Microsoft Word). The other options given aren't correct ways to open Microsoft Word. For example, the File menu refers to options within a program that's already open, not a way to launch the program. So, the correct option is: (a) Start -> All Programs -> Microsoft Word.

Q17. Which one is true about the generation of computers?

- (A) The first generation (1942-1954)
- (B) The second generation of computer (1954-1964)
- (C) Fourth generation of computer (1975-1984)**
- (D) Third generation of computer (1965-71)

Solution: (c) Third generation of computer → The third generation computer was started in 1965 and ended around 1971. Third generation computers start using integrated circuits instead of transistors. First generation → 1946-1959 is the period of first generation computers. Second generation of computer → Second Generation of Computers (1957 – 1963). Fourth generation of computers → Fourth-generation computers were released in 1972.

Q18. Which network security feature prevents users on a network from accessing unauthorized programs and information?

- (A) Firewall**
- (B) Antivirus
- (C) Jammer
- (D) Security Plus

Solution: The correct answer is option A. A firewall is a network security feature that prevents unauthorized access and controls the flow of data between a private network and the outside world, including the internet. It can be set up to prevent certain programs and information from entering or leaving the network, thus preventing users from accessing unauthorized resources. Firewalls help protect against various cyber threats and maintain the security of the network environment.

Q19. State whether the following statements are true or false. (i)

In MS Word, all paragraphs can have the right alignment. (ii) In MS Word, all paragraphs cannot have the same hanging position.

- (A) (i) True, (ii) False**
- (B) (i) False, (ii) True
- (C) (i) True, (ii) True
- (D) (i) False, (ii) False

Solution: (a) In MS Word, all paragraphs can have the right alignment. In MS Word, all paragraphs can have the same hanging position.

Q20. Which of the following is not an option of cell alignment in a table in MS-Word 2007?

- (A) Align bottom right
- (B) Align center
- (C) Align across**
- (D) Align top left

Solution: (c) Cell alignment types in MS WORD - Align Left – It aligns the text to the left edge of the cell. Center – It aligns the text in the center of the cell. Align Right – It aligns the text to the right edge of the cell. There are 4 types of text alignments which are left-aligned, center-aligned, right-aligned, and justified.

Q21. Which of the following steps is used to format a cell in an MS Excel spreadsheet?

- (A) View → Select cell → Format
- (B) Select cell → Right Click → Format Cell**
- (C) Menu → Select cell → Format
- (D) Select Cell → View → Format

Solution: The correct answer is (b) Select cell → Right Click → Format Cell. Explanation: The correct step to format a cell in an MS Excel spreadsheet is selecting the cell, then right-clicking, and then choosing Format Cell from the context menu. This action opens the Format Cells dialog box, where users can change various properties of the cell, including number format, alignment, font styles, borders and fill colours. This method is quick and effective for accessing direct formatting options.

Q22. An integrated circuit is commonly known as:

- (A) Resistor
- (B) Transistor
- (C) Plate
- (D) Chip**

Solution: The correct answer is option D. An integrated circuit is commonly known as a 'chip'. It is a small electronic device that contains various components such as transistors, resistors, and capacitors, integrated onto a semiconductor wafer or substrate. These components work together to perform specific electronic functions, and integrated circuits are a fundamental building block of modern electronic devices and computers.

Q23. _____ ignores null values and ____ accept null values .

- (A) Group function, Group by**
- (B) Group by, Group function
- (C) Order by, Group by
- (D) Order by, Group function

Solution: (a) Group function returns one result per group row. It ignores null values. Group by is used to group duplicate rows. It accepts null values.

Q24. _____ is a computer on which more than 100 people can work at a time on different terminals, through time sharing and multi-tasking techniques.

- (A) Mini computer
- (B) Mainframe computer**
- (C) Workstation
- (D) Personal computer

Solution: The correct answer is option B. A mainframe computer is a high-performance computing system designed to handle large

amounts of data and support multiple users simultaneously through techniques like time-sharing and multi-tasking. It is capable of accommodating more than 100 users working simultaneously on different terminals, making it suitable for large-scale data processing and enterprise-level computing tasks.

Q25. Which of the following logical relational operators in C means 'not equal to'?

- (A) #
- (B) ==
- (C) !=**
- (D) <=

Solution: The correct answer is (c) !=. Explanation: !=: this is the 'not equal to' operator in C. It is used to compare two values, and if they are not equal, it returns true (non-zero), otherwise it returns false (zero). #: this is not a logical operator in C; it is used in preprocessor directives (e.g. #include). ==: this is the equality operator, used to check if two values are equal. <=: this is the 'less than or equal to' operator, used to compare whether one value is smaller than or equal to another.
