

Ozempic is throwing a new ‘mini’-challenge at restaurants and customers. The solution may be simple

If **gluttony** is the foundation on which the **edifice** of the modern restaurant industry was built, could the **GLP-1** class of drugs be the **wrecking ball** that brings it all **crashing down**? From London to Dubai to New York City, **eateries** are faced with the newly **shrunk appetites** of customers, **thanks to** the “**miracle**” **wrought** by drugs like Ozempic and Wegovy. This has **led to** a **scramble** to design special “mini meal” menus, of smaller servings with appropriate pricing; after all, **customers** who push food around on their plates after just a few bites **cannot** be expected to stomach the prices for regular portion sizes.

That these **so-called** “mini” portions are closer to the actual recommended servings **is**, of course, what **lends** a **tinge** of **irony** to the restaurant industry’s **predicament**. The **finding** of a 2016 study, published in the Journal of the American Academy of Nutrition and Dietetics, that most restaurants’ individual main courses alone exceed the recommended calories for a single meal, **underscored** the **extent** to which the culture of **eating out** has contributed to **obesity** and related illnesses. Other studies have **highlighted** the **phenomenon** of “portion **distortion**”, showing how even restaurant plates have grown in size over the **decades**, contributing to the problem of overeating.

It appears that the **hunger-curbing** power of GLP-1 drugs may succeed where **mere will-power** has repeatedly failed (the **cephalic phase** of digestion in humans **kicks in** at the very **sight** and smell of food). Yet, even as restaurants **recalibrate** their business models for a future where burgers and fries are no longer “super-sized” and fewer and fewer customers order enough food for there to be a **doggy** bag, **weight-watchers** themselves might consider **revisiting** a **hoary** piece of advice: Eat more at home. It is both healthier and cheaper.

Summary of the Editorial

1. The restaurant industry has long thrived on large portion sizes and overeating habits.
2. GLP-1 drugs like Ozempic and Wegovy are significantly reducing customers' appetites.
3. Restaurants in cities like London, Dubai, and New York are noticing a change in dining patterns.
4. Customers now often leave most of their food uneaten after just a few bites.
5. This has prompted eateries to create "mini meal" menus with smaller portions and adjusted prices.
6. Ironically, these "mini" portions match the recommended serving sizes for healthy eating.
7. A 2016 study found that most restaurant main courses exceeded the advised calorie count for one meal.
8. The culture of eating out has been linked to obesity and related health issues.
9. "Portion distortion" has occurred over the years, with plates and servings growing much larger.
10. GLP-1 drugs may succeed in reducing overeating where willpower alone often fails.
11. Human appetite is strongly triggered by the sight and smell of food (cephalic phase of digestion).
12. Restaurants may need to restructure their business models for a smaller-portion future.
13. The era of "super-sized" fast food may be coming to an end.
14. Customers are also ordering less, reducing leftovers and "doggy bag" culture.
15. A simple health and cost-saving tip remains: Eat more meals at home instead of eating out.
